IN THE MATTER OF THE PETITION OF THE CITY OF MARION, INDIANA, FOR APPROVAL TO ISSUE BONDS AND ADJUST ITS RATES AND CHARGES

CAUSE NO.

PREFILED DIRECT TESTIMONY

OF

ANDREW BURNHAM

ON BEHALF OF

THE CITY OF MARION, INDIANA

I. <u>INTRODUCTION</u>

1 1. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Andrew Burnham. My business address is 777 South Harbour Island
Boulevard, Suite 600, Tampa, Florida 33602.

4 2. WHAT IS YOUR OCCUPATION?

A. I am a Vice President with Stantec Consulting Services Inc. ("Stantec") and Director of
Management & Technology Consulting. In that capacity, I have responsibility for the
delivery and oversight of the company's asset management, organizational performance,
financial, economic, funding, and technology advisory services to hundreds of
communities throughout North America. While these services are provided across multiple
sectors, they are predominantly focused within the water industry.

11 3. WHAT IS YOUR EDUCATIONAL BACKGROUND?

A. I hold a Bachelor of Science degree in Business Administration, as well as an Associate
 Personal Computer Specialist degree from Lake Superior State University. Moreover, I
 have attended multiple classes in utility ratemaking from several industry groups, including
 the American Water Works Association ("AWWA"), the American Gas Association, and
 the Edison Electric Institute.

17 4. PLEASE DESCRIBE YOUR PROFESSIONAL EXPERIENCE.

A. From January 2001 through July 2003, I worked for Consumers Energy Company as an
 analyst within the Rates Department where I focused on various elements of revenue
 requirements, cost of service allocations, pricing, and tariff administration for retail, as well
 as wholesale customers of the electric and natural gas systems. In July of 2003, I began my

employment with Burton & Associates, a specialty consulting services company focused
on providing water resources rate setting and financial management advisory services to
local governments and private utilities. Over time, I received various promotions,
ultimately becoming Vice President and co-owner prior to the sale of the company in
December of 2015 to Hawksley Consulting, a subsidiary of Montgomery Watson Harza,
which Stantec Consulting Services Inc. acquired in 2016.

Since 2003, my focus has been predominantly on water resources financial management 7 and rate setting for public and private utilities. During my career, I have personally 8 conducted or managed hundreds of water rate studies for more than a hundred communities 9 throughout North America, mostly in the United States. As such, I am an active and 10 contributing member of the Rates & Charges Committee and the Finance, Accounting & 11 Management Controls Committee of the AWWA. I also serve as the Vice Chair and a 12 Trustee of the Management & Leadership Division of AWWA that oversees these 13 committees. Among my contributions, I led the development of the first ever Cash 14 Reserves Policy Guidelines report and corresponding policy statement for AWWA, and I 15 co-authored the current seventh edition of the Manual of Water Supply Practices M1 16 Principles of Water Rates, Fees, and Charges ("M1") published by the AWWA in January 17 of 2017¹. At present, I serve as a co-author for two manual updates being pursued by the 18 AWWA: first, an update to the fourth edition of its Manual of Water Supply Practices M29 19 Water Utility Capital Financing, and second, an update to the current seventh edition of 20 M1. 21

¹ Unless otherwise noted, all references in my testimony to M1 are to the 7th edition of M1.

1		Additionally, I serve as an instructor for the water portion of the Advanced Ratemaking
2		Program of the Institute of Public Utilities of Michigan State University. I also maintain
3		memberships in other notable and relevant industry groups, including the Utility Resource
4		Management Committee of the Water Environment Federation, the National Association
5		of Clean Water Agencies, and the Government Finance Officers Association. I routinely
6		prepare publications and make presentations on water resources management and rate
7		setting topics for various industry groups.
8		Further information on my qualifications and experience is included in Petitioner's Exhibit
9		<u>13</u> .
10	5.	HAVE YOU PREVIOUSLY TESTIFIED IN ANY REGULATORY
11		PROCEEDINGS?
12	А.	Yes. I have prepared and/or provided utility rate related testimony before utility regulatory
13		commissions in Arizona, Florida, Indiana, Michigan, the United States Virgin Islands, and
14		the Federal Energy Regulatory Commission, and in circuit and district courts in various
15		states. The subject of my testimony in these matters varied, including but not limited to:
16		revenue requirements; rate adjustments; cost of service allocations; pricing structures; rate
17		base and return on investment; wholesale rates; utility acquisitions; connection and capital
18		cost recovery charges; and miscellaneous fees and user charges.
19		
20		
21		II. OVERVIEW OF TESTIMONY
22	6.	WHAT IS THE PURPOSE OF YOUR ENGAGEMENT AND TESTIMONY IN
23		THIS PROCEEDING?

1	A.	Stantec was engaged by the City of Marion, Indiana ("Marion"), to prepare a cost of service
2		and rate design analysis to develop proposed schedules of rates and charges for water
3		service. Stantec completed a cost of service and rate design analyses based on the Phase I
4		revenue requirements using customer data from a test year of June 2021 to May 2022, and
5		then developed a multi-year schedule of rates and charges for Phase I through Phase V
6		revenue requirements. The rationale for the test year as well as the revenue requirements
7		for each phase were provided to Stantec by Marion's municipal advisor, Crowe, LLP
8		("Crowe").
9	7.	PLEASE DISCUSS HOW YOUR DIRECT TESTIMONY IS ORGANIZED.
10	A.	My testimony is organized into the following sections:
11		I. Introduction
12		II. Overview of Testimony
13		III. Cost of Service Study
14		IV. Proposed Water Rates and Charges
15	8.	WHAT ATTACHMENTS ARE YOU SPONSORING IN THIS PROCEEDING?
16	A.	I am sponsoring the following attachments, some of which have multiple parts:
17		Petitioner's Exhibit 13 Business Experience and Qualifications of Andrew Burnham
18		Petitioner's Exhibit 14 Phase I Cost of Service Detailed Schedules
19 20		Petitioner's Exhibit 15 Rate Design Schedules and 5-year Schedule of Rates and Charges
21	9.	WERE THESE ATTACHMENTS PREPARED BY YOU OR PREPARED UNDER
22		YOUR DIRECT SUPERVISION?
23	А.	Yes. I either prepared each of the schedules or provided supervision as to their preparation.

1 10. PLEASE DESCRIBE THE GENERAL ARRANGEMENT OF THESE 2 ATTACHMENTS.

3 A. Petitioner's Exhibit 13 identifies my business experience and qualifications.

- <u>Petitioner's Exhibit 14</u> includes detailed schedules presenting the steps and results for the
 cost of service study
- Petitioner's Exhibit 15 includes detailed schedules supporting the rate design analysis and
 resulting schedule of rates and charges to meet Phase I Phase V revenue requirements.
- 8

III. COST OF SERVICE STUDY

9 11. PLEASE PROVIDE A SUMMARY OF YOUR COST OF SERVICE STUDY
 10 TESTIMONY.

11 A. This testimony will describe the purpose of the cost of service study, identify the data and 12 methodology relied upon in completing the analysis, and present the resulting allocations 13 to each customer class that informed the development of recommended rates and charges.

14 12. PLEASE DESCRIBE THE PURPOSE OF A COST OF SERVICE STUDY.

A. The basic premise in establishing fair and equitable rates is that rates should reflect the cost
 of providing service to each customer class. The water system provides service to various
 classes of customers who have different water use patterns and service characteristics. A
 cost of service study determines proportional allocations of costs between defined customer
 classifications to support the development of rates and charges that recover the costs
 incurred to serve each respective customer classification.

The cost of providing service can be reasonably determined for groups or classes of customers that have similar water-use characteristics. Rate-making endeavors to assign costs to classes of customers in a nondiscriminatory, cost-responsive, and proportional

manner so that rates can be designed to closely meet the cost of providing service to such 1 customer classes (AWWA M1, page 73). Stantec has followed the "base-extra capacity" 2 methodology outlined in the M1 to allocate costs to system functions and then to each 3 customer class based on identified units of service. The AWWA Manual M1 (M1) 4 identifies two methodologies for the allocation of water utility costs, the base-extra 5 capacity method and the commodity-demand method. The base-extra capacity method is 6 the most common method utilized and provides for the determination of costs associated 7 with meeting average day versus peak demands that is useful in analyzing differences 8 between the cost of serving various customer classifications and in developing rate 9 structures. The intent of the M1 is to provide guidance and advice so that a utility may 10 create cost-based rates that reflect the distinct and unique characteristics of that utility and 11 the values of the community. 12

13 13. WHERE DID YOU OBTAIN THE DATA USED TO PERFORM THE COST OF 14 SERVICE STUDY?

The data used to prepare the study was provided by Marion from its business records, from 15 Α. Crowe, or is otherwise available to individuals working in the utility rate and financing 16 field. Based upon my experience, the type of data used in the study is consistent with 17 general industry practice. Specifically, Crowe provided the test year revenue requirement 18 and future revenue requirement schedules shown in Petitioner's Exhibit 10 sponsored by 19 the Petitioner's witness Jennifer Wilson. Data provided by Marion includes organizational 20 structure and staffing, operating statistics, historical water production, customer billing 21 data, rate schedules, fire flow requirements, and occurrences of fires. Lastly, some of the 22 materials I reviewed to prepare my testimony in this Cause includes, but is not limited to, 23

the AWWA M1, our files regarding previous rate cases, as well as other materials which 1 are normally examined to allocate system costs and develop utility rates and charges. 2

PLEASE DESCRIBE THE METHODOLOGY EMPLOYED IN DEVELOPING 14. 3

4

THE COST OF SERVICE ANALYSIS.

Stantec has followed the American Water Works Association's "Base-Extra Capacity" A. 5 methodology to allocate costs based on the demand and use of each customer class. This 6 method is described in detail in the AWWA's M1 Principles of Water Rates, Fees, and 7 Charges Manual. The base-extra capacity method has been widely utilized and is a well-8 accepted methodology used by public service commissions and water systems throughout 9 the United States. Under the base-extra capacity method, Marion's costs (i.e., revenue 10 requirements) are first categorized into the following system functions according to the 11 design and operation of the water system and available data: treatment, distribution, and 12 customer. Some costs can be directly attributed to a function based on the type of expense 13 and department in which it is belongs. Other costs, such as Administrative and General 14 or Capital, will be assigned to each function with the use of allocation factors based on 15 organizational statistics, capital projects, and other operating data as appropriate. 16

The functionalized costs are then allocated to the following cost components according to 17 how they support the operation of the water system to meet base (average day) demands, 18 extra-capacity (max day and max hour) demands, and customer service and billing needs 19 to determine system-wide unit costs. Then the unit costs are applied to the respective units 20 of service for each customer class to distribute costs proportionally. Essentially, the 21 combination of how each customer class uses the base capacity and peak capacities of the 22

water system and associated costs functionalized to each of those cost components will
 define the cost to serve each customer class.

The intent of the M1 is to provide guidance and advice so that a utility may create cost-3 based rates that reflect the distinct and unique characteristics of that utility and the values 4 of the community. As such, from the application of the principles and methodologies 5 therein, a utility may create cost-based rates that reflect the distinct and unique 6 characteristics of that utility and the values of the community (AWWA M1, page 5). Said 7 simply, utilities are like snowflakes, and while there may be many similarities, there will 8 also be differences that require modifications to approaches and methods employed to best 9 fit the circumstances and available data/resources. A good example is the range in the 10 number and type of system functions employed across utility systems. Some systems may 11 be able and need to break out their costs more granularly and subsequently utilize a greater 12 number of functions in their allocation process (such as supply, treatment, transmission, 13 distribution, pumping, storage, meters/service lines, customer service, etc.) than was done 14 in this instance for Marion. 15

15. PLEASE DESCRIBE THE <u>PETITIONER'S EXHIBIT 14</u> COST OF SERVICE
 DETAILED SCHEDULES.

A. <u>Petitioner's Exhibit 14</u> consists of several schedules representing the various steps in the
 cost of service study process:

Schedule 1 – Allocation Factors presents the allocation factors applied to the revenue
 requirements to determine the costs associated with each water system function
 (Treatment, Distribution, and Customer).

Schedules 1A- Administration FTEs displays organizational information used to develop
 certain allocation factors on Schedule 1.

Schedule 1B – Schedule 1B displays Phase 1 and 2 of the Capital Improvement Program 3 (CIP) used to develop certain allocation factors on Schedule 1. This CIP was prepared for 4 the rate increases and ordinances presented and approved by the Common Council of the City of 5 Marion, Indiana (the "Original CIP"), as described in Petitioner's Exhibit 9 sponsored by 6 Jennifer Wilson. The estimated pricing of the CIP projects has been very volatile and thus has 7 been updated to reflect more recent estimates in the Preliminary Engineering Report. However, at 8 this time the Revenue Requirements presented in Petitioner's Exhibit 10 will not be updated for the 9 revised CIP. The cost of service will be updated when the Utility files a true-up report with the 10 Commission to reflect the project costs and final financing as described in Petitioner's Exhibit 9 11 sponsored by Jennifer Wilson. 12

Schedule 2 – Water Expense Allocation presents the allocation of Test Year Water
 Revenue Requirements provided by Crowe to the defined system functions. Each line item
 of the revenue requirements is assigned an allocation factor from Schedule 1 based on the
 type of expense and the department.

Schedule 3 – Water Non-Rate Revenue Allocation displays the non-rate revenues provided by Crowe. Each line item of non-rate revenue is allocated to customer classes based on the weighted average cost of service results for each class. This is a reasonable approach given that the source of the revenue is not specific to one class of customer and therefore is shared based on ratio of costs to all customer classes. The non-rate revenues offset the gross cost of service for each customer class. Schedule 4 – Functions and Flows presents a summary of annual water production data for
the last three full calendar years provided by Marion. The calculated coincident peaking
factors used in this study for the water system were calculated using an average of the
three-year period of January 2019 – December 2021. This schedule also shows the
utilization of these factors to allocate the costs of each function to the base, extra capacity
max day, extra capacity max hour, and customer cost components.

Schedule 5 – Units of Service presents the annual water use for each of the customer classes
served by Marion (Residential, Commercial, Industrial, and Institutional) for the test year.
It shows the calculation of max day and max hour demands by customer class and presents
the units of service by cost component.

Schedule 6 – Max Day and Max Hour Compression Factors by Class displays weekly and
 daily water use assumptions by customer class and details the calculation of compression
 factors utilized on Schedule 5.

Schedule 7 – Fire Protection Units of Service and Functions shows fire protection flow needs and the calculated units of service for the extra capacity max day and extra capacity max hour cost components. It also displays the methodology used to distribute fire protection costs to public fire protection and private fire protection categories based on the ratio of equivalent services in each category.

Schedule 8 – Unitization displays the calculated unit rate for each cost component (base,
max day, max hour, and customer). This schedule brings together the function costs from
Schedule 2, the allocation of those costs to the base, max day, max hour, and customer cost
components from Schedule 4, and the total Units of Service from Schedule 5.

Schedule 9 – Water Cost of Service calculates the net cost to serve each customer class and
 compares the costs with the current revenues from each class to identify the rate adjustment
 necessary to meet the Phase I cost of service and revenue requirements.

4

17. PLEASE FURTHER EXPLAIN SCHEDULE 2 IN PETITIONER'S EXHIBIT 14

5

AND HOW COSTS ARE ALLOCATED TO EACH FUNCTION.

Schedule 2 in Petitioner's Exhibit 14 presents the revenue requirements for Phase I. The 6 A. expenses line items were provided by Crowe and are aggregated by type of expense and 7 department. Each line item of expense is assigned an allocation factor defined on Schedule 8 1 in Petitioner's Exhibit 14. Department expenses associated with wells and treatment 9 were allocated to Treatment function. Department expenses associated with Distribution 10 were allocated to the Distribution function. Department expenses for Customer Accounts 11 were allocated directly to the Customer function. Department expenses for Administrative 12 and General were allocated to each of the function based on a breakdown of the job function 13 of staff included in the Administrative and General department, shown on Schedule 1A. 14 Phase I capital expenses are assigned to functions based on the funding source and type of 15 project as shown on Schedule 1B. 16

17 18. PLEASE EXPLAIN THE BASIS OF YOUR ALLOCATION OF FUNCTIONAL

18

COSTS TO THE BASE AND EXTRA CAPACITY COST COMPONENTS.

A. Schedule 4 of <u>Petitioner's Exhibit 14</u> displays how the costs of each function are allocated
to the base and extra capacity components. Treatment costs are allocated to base and extra
capacity max day cost components as these facilities are typically designed to meet max
day demands but are also used to meet average day demands (i.e. the base cost component).

23 The allocation of the treatment function to the base component is calculated as a ratio of

the average day demands to the max day demands. The remaining treatment costs are 1 allocated to the extra capacity max day cost component. Distribution costs are allocated to 2 the base, extra capacity max day, and extra capacity max hour costs components as water 3 mains are sized and utilized to meet all three types of demands. The allocation of the 4 distribution function to the base component is calculated as a ratio of average day demands 5 to max hour demands. The allocation of the distribution function to the extra capacity max 6 day component is calculated as a ratio of the difference between the max day and average 7 day demands divided by the max hour demands. The remaining distribution function costs 8 are then allocated to the extra capacity max hour cost component. Schedule 8 applies these 9 allocation factors to the function costs and displays the total costs allocated to each cost 10 11 component.

12 19. PLEASE FURTHER EXPLAIN SCHEDULE 4, SPECIFICALLY THE 13 CALCULATION OF THE WATER SYSTEM COINCIDENT PEAKING 14 FACTORS.

When evaluating system maximum day and peak hour demands, water production data is 15 often utilized. In this instance average day, maximum day, and peak hour production data 16 for calendar years 2019, 2020, and 2021 was provided by Marion. A multi-year average 17 was calculated and utilized as the basis of establishing system max day and peak hour 18 demands for purposes of establishing cost allocations to cost components (and for 19 comparing to noncoincident customer demands). Variation in water production from year 20 to year is not unique to Marion, as many utilities across the country experience changes in 21 water production due to changes in weather conditions or other factors. Specifically, over 22 this period, many utilities also experienced changes in water production and water use 23

patterns due to impacts of the COVID-19 Pandemic. Therefore, a multi-year average was
 used to establish the system max day and max hour demands for the cost of service analysis.

CY	Average Day (MGD)	Max Day (MGD)	Max Hour (MGD)	Max Day Factor	Max Hour Factor
2019	3.985	5.497	8.900	1.38	2.23
2020	3.741	4.608	8.600	1.23	2.30
2021	3.897	4.612	8.700	1.18	2.23
Average	3.874	4.906	8.733	1.27	2.25

3

4 20. PLEASE FURTHER EXPLAIN SCHEDULE 5, SPECIFICALLY THE 5 CALCULATION OF THE NON-COINCIDENT MAX MONTH DEMAND 6 FACTOR FOR EACH IDENTIFIED CUSTOMER CLASS.

Marion provided monthly billing data for the period of January 2019 thru May 2022. The 7 billing data identifies the monthly usage, type of customer, and service type among other 8 customer information. There are six customer types: residential, commercial, industrial, 9 institutional, municipal, agricultural, and other. Together the municipal, agricultural, and 10 other category of customers make up less than 4% of the annual consumption and represent 11 only 330 customers (3% of total number of customers). Additionally, we learned from 12 discussion with Marion that the 'other' customer type represents customers that are not 13 within the City's municipal limits but still receive services from the City. This category 14 includes a mix of residences, public/institutional customers, and commercial customers. 15 Therefore, it was determined that the cost of service would be completed for the major 16 customer classes of residential, commercial (including agricultural), industrial, and 17 The other customers were distributed into the institutional (including municipal). 18

residential, commercial, and institutional customer classes based upon a revenue
 reconciliation analysis.

This billing data was compiled by customer class for each month to identify the max month consumption for each calendar year 2019, 2020, 2021, and the test year of June 2021 – May 2022. The max month consumption for each customer class was compared to the average to calculate a max month demand factor for each customer class. The max month factors by customer class for each calendar year and the test year are shown in the table below.

Customer Class	CY 2019	CY 2020	CY 2021	Test Year	Average 3-year (CYs 2019, 2020, 2021)
Residential	1.15	1.17	1.10	1.10	1.14
Commercial	1.26	1.18	1.20	1.18	1.21
Industrial	1.86	1.17	1.27	1.27	1.43
Institutional	1.48	1.24	1.16	1.13	1.29

As shown above, the resulting max month factors for each customer class varied over this 10 period. Like the discussion of water production data, this type of variation is not unique to 11 Marion. These results were discussed with Marion staff, and were determined to be 12 reasonable, particularly given the stability of the customer base during this period and 13 consideration of other factors/variables that cause water use changes from year to year. 14 Therefore, a multi-year average of max month factors was utilized in the analysis. The 15 non-coincident max month factors were applied to the average daily demands from the test 16 year to establish the non-coincident max month demand for each customer class shown on 17 line 4 on Schedule 5 of Petitioner's Exhibit 14. 18

9

CAN YOU EXPLAIN THE NON-COINCIDENT MAX DAY DEMANDS CALCULATED FOR EACH CUSTOMER CLASS ON SCHEDULE 5 IN PETITIONER'S EXHIBIT 14?

Max day water usage by customer class is a data point that is not readily available for most 4 water systems in the country unless they have advanced metering infrastructure. As such, 5 it is common practice that the max day demands by customer class are calculated using a 6 combination of monthly billing data, coincident (system) factors, and general 7 understanding or assumptions of typical usage profiles for the respective customer classes. 8 The non-coincident max day demands calculated for each customer class on Schedule 5 9 are based on the non-coincident max month demands, the coincident max month to max 10 day factor of the system, and max day compression factors based on weekly usage 11 assumptions for the respective customer classes. 12

The system-wide max month to max day factor of 1.18 is calculated on Schedule 4 and is the ratio of the system or coincident max month water production to the max day water production. Like the calculation of the coincident max day and max hour factors, a threeyear average of max month and max day values were used in the calculation of the system max month to max day factor.

Max day compression factors were established for each of the customer classes and shown on Schedule 6 in <u>Petitioner's Exhibit 14</u>. The schedule shows the assumed weekly use assumptions used for each customer class. This methodology is consistent with the methodology of estimating non-coincident peaking factors as identified in Appendix A of the AWWA M1 and our experience with other utility systems. The max day compression factors, along with the max month to max day factors, are applied to the non-coincident max month demands for each customer class to determine the non-coincident max day
 demand of each customer class shown on line 7 on Schedule 5 and utilized to calculate the
 max day units of service shown on line 20 on Schedule 5 of <u>Petitioners Exhibit 14</u>.

4

22. HOW DID YOU EVALUATE THE CALCULATED NON-COINCIDENT MAX

5

DAY DEMANDS FOR REASONABLENESS?

The aggregate maximum day non-coincident demands calculated from these assumptions 6 are divided by total system average day demands and then compared against the ratio of 7 the coincident maximum day demands of the system to average day demands to measure 8 the system diversity of demand, consistent with Appendix A of M1. The system diversity 9 ratio is typically in the range of 1.1 to 1.4 for the majority of systems, though different 10 system diversity measures may arise for communities, depending upon their specific 11 circumstances and data. This system diversity measure is a method to ensure that the 12 maximum day peaking factors selected for each customer class, based on the data available 13 and the assumptions regarding variation in consumption patterns, likely result in reasonable 14 approximations of the overall class maximum-day demands for cost allocation purposes. 15 The aggregate max day non-coincident demand AWWA M1, Appendix A, page 377. 16 factors and the system diversity ratios are shown on Schedule 5. The system diversity ratio 17 of 1.53, while slightly above the typical range, supports that the maximum-day peaking 18 factors selected for each of the classes, based on the data available and the assumptions 19 regarding variation in consumption throughout the week, result in reasonable 20 approximations of the overall class maximum-day demands for cost allocation purposes. 21

CAN YOU EXPLAIN THE NON-COINCIDENT MAX HOUR DEMANDS CALCULATED FOR EACH CUSTOMER CLASS ON SCHEDULE 5 AND HOW THESE VALUES ARE EVALUATED FOR REASONABLENESS?

This is again an instance of a data point that is not readily available for many water systems in the country and often these adjustment factors are based on general understandings or assumptions of typical usage profiles for the respective customer classes. Max hour compression factors were calculated for each of the customer classes as shown on Schedule 6. The schedule shows the assumed hours per day or water use assumptions for each customer class. This method is consistent with the methodology of estimating noncoincident peaking factors as identified in Appendix A of the M1.

The max hour compression factors are applied to the non-coincident max day demands for each customer class to determine the non-coincident max hour demand of each customer class shown on line 12 on Schedule 5 and utilized to calculate the max hour units of service shown on line 23 on Schedule 5.

The aggregate max hour non-coincident demands calculated from these adjustment 15 assumptions divided by the total system average day demands can be compared against the 16 ratio of coincident max hour demands of the system divided by the total average day 17 demands to measure the system diversity of demand per Appendix A of M1. The system 18 diversity ratio is often in the range of 1.1 to 1.4, though different system diversity measures 19 may arise for communities with more atypical customer class usage patterns. This system 20 diversity measure is another method to ensure that the max hour factors selected for each 21 customer class, based on the data available and the assumptions regarding variation in 22 consumption patterns, likely result in reasonable approximations of the overall class max 23

hour demands for cost allocation purposes. AWWA M1, Appendix A, page 378. The system diversity ratio of 1.32 supports that the peak hour factors selected for each of the classes, based on the data available and the assumptions regarding variation in consumption throughout the week, result in reasonable approximations of the overall class peak hour demands for cost allocation purposes.

6 24. CAN YOU FURTHER EXPLAIN THE TOTAL UNITS OF SERVICE 7 CALCULATED ON SCHEDULE 5, SPECIFICALLY, THE FIRE PROTECTION 8 PUBLIC AND PRIVATE UNITS OF SERVICE?

Schedule 5 in Petitioner's Exhibit 14 summarizes the units of service for each cost 9 component by customer class. In addition to the units of service for each of the customer 10 classes, units of service for the public and private fire protection services must also be 11 established. The calculation of the fire protection units of service is shown on Schedule 7. 12 Fire protection units of service were determined by estimating the required flow needs for 13 a typical residential fire and large fire (non-residential). The assumed flows to fight a 14 typical residential fire (1,500 gallons per minute) were assumed for a 2-hour duration, 15 while the assumed flow (3,500 gallons per minute) to fight a large non-residential fire are 16 assumed for a 3-hour duration. These assumptions are supported by the Marion Fire 17 Department, Public Protection Classification (PPC) Summary Report prepared by the 18 Insurance Service Office (ISO) in March 2022. The flow rates are multiplied by the 19 duration to get a total amount of needed flow on a max day for each fire. The max hour 20 flows represent the needed flow for one hour for each fire. The flow requirements for each 21 type of fire are added together to get the total fire flow demands of the water system on a 22 max day and max hour basis. 23

Verified Direct Testimony of Andrew Burnham <u>Petitioner's Exhibit 12</u> City of Marion, Indiana Page 19 of 29

The allocation factors used to distribute these required flows to the public and private fire 1 protection customer classes is also calculated on Schedule 7. The Marion Fire Department 2 PPC Summary report provided a count of all the public fire hydrants served by the Marion 3 water system. Marion also provided a summary of the number of private fire hydrants and 4 private sprinkler heads and associated accounts served and billed each year. To distribute 5 the fire protection needs between the public system and customers with private systems, 6 hydrants and services providing sprinkler protection were normalized to an equivalent 7 service unit using the Hazen-Williams equation for flow through pressure conduits as 8 diameter raised to power of 2.63. Typical fire protection appurtenances like hydrants and 9 sprinkler heads are served by lines of 6" diameter. The demand factors were applied to 10 the number of service lines, assuming 1 dedicated line for each hydrant and 1 dedicated 11 service line for each sprinkler head account, and the resulting allocation factors are shown 12 on lines 1, 2, and 3 of Schedule 7. As a result, 79% of the required fire flows on a max 13 day and max hour basis will be distributed to the public fire protection service and the 14 remainder to private fire protection service. These are summarized in the unit of service 15 table on Schedule 5. 16

17 25. PLEASE FURTHER EXPLAIN SCHEDULE 9 IN <u>PETITIONER'S EXHIBIT 14</u> 18 AND SUMMARIZE THE RESULTS OF THE COST OF SERVICE STUDY?

A. Schedule 9 provides the summary of all the costs allocated to each customer class and
compares the assigned costs for each customer class with the projected revenues from each
class to identify the level of rate adjustment necessary to meet the cost of service
requirements for Phase I. Lines 1 through 4 display the units of service by cost component
(base, max day, max hour, and customer) for each customer class calculated on Schedule

5 and Schedule 7 for fire protection. Lines 5 through 8 display the unit costs by cost
 component determined on Schedule 8. The unit costs were calculated by dividing the
 allocated facility costs by the units of service for each cost component.

Lines 10 - 15 calculate the cost by component for each customer class, and line 15 shows 4 the gross cost to serve each customer class. The gross cost of service is offset by non-rate 5 revenues and is allocated to each of the customer classes based on the weighted average of 6 the gross cost of service allocation. Finally, the net cost of service or revenue requirement 7 for Phase I of each customer class is shown on line 17 and compared to existing revenues 8 on line 18. The table below summarizes the results of the cost of service by customer 9 As shown in the table below, and consistent with Phase I revenue requirements 10 class. provided by Crowe, there is an overall need to increase revenues by 16% to meet the 11 revenue requirements in Phase I. However, the increases or change in revenue to each 12 customer class varies based upon the cost to serve as discussed in this testimony. The cost 13 of service results indicate that the residential customer class requires an adjustment less 14 than the overall average, while the commercial, industrial, and institutional customer 15 classes require increases greater than the overall average. Fire Protection Charges are 16 currently set higher above the allocated amounts of the Phase I revenue requirement. 17

Verified Direct Testimony of Andrew Burnham <u>Petitioner's Exhibit 12</u> City of Marion, Indiana Page 21 of 29

	Total Cost to Serve (Phase I)	Existing Revenues	% Change
Residential	\$2,215,059	\$1,960,077	13.0%
Commercial	\$737,421	\$576,452	27.9%
Industrial	\$316,706	\$178,409	77.5%
Institutional	\$618,735	\$419,617	47.5%
Fire Protection - Public	\$489,905	\$557,141	-12.1%
Fire Protection - Private	\$131,927	\$197,236	-33.1%
Total	\$4,509,754	\$3,888,932	16.0%

The results above are not surprising given that Marion has not completed a cost of service 2 study or adjusted its rates in nearly twenty years. The magnitude of changes required in 3 each customer class can largely be attributed to the change in customer base and water use 4 patterns over time since the last cost of service has been completed, as well as changes in 5 nature of Marion's cost requirements (and distributions of those requirements) since rates 6 were last established. Stantec recommends that the cost of service be updated every three 7 to five years to account for changes in operation, capital planning, customer base, or 8 9 customer usage.

Additionally, unit costs were calculated for each customer class, excluding public and private fire protection costs. The unit costs are shown in the following table.

1

Verified Direct Testimony of Andrew Burnham <u>Petitioner's Exhibit 12</u> City of Marion, Indiana Page 22 of 29

	Total Cost to Serve (Phase I)	Less Customer Charge Revenues	Cost to be recovered from Variable Rate	Annual Water Use (CCF)	Unit Costs (\$ per CCF)
Residential	\$2,215,059	-\$494,770	\$1,720,289	526,197	\$3.27
Commercial	\$737,421	-\$65,340	\$672,081	223,760	\$3.00
Industrial	\$316,706	-\$2,864	\$313,842	101,009	\$3.11
Institutional	\$618,735	-\$15,486	\$603,249	195,736	\$3.08
Total	\$3,887,922	-\$578,460	\$3,309,461	1,046,701	\$3.16

The unit costs are calculated by subtracting the projected customer charge revenues from 2 the total cost to serve and dividing by the annual water use for each customer class in 3 hundred cubic feet (CCF). It is important to note that Marion currently does not have 4 separate rates for each individual customer class, but instead applies a single retail rate 5 structure. Specifically, there is one rate structure and schedule of rates and charges applied 6 to all customers and meter sizes. The advantages of a single rate structure for all customers 7 is that it is easy to administer and easy to communicate to customers. Considering the 8 small differences between the calculated unit rates per class, past practice, and the 9 advantages of one rate structure, the proposed rate design continues to utilize a single rate 10 structure for all customers. 11

12

1

PROPOSED WATER RATES AND CHARGES

13 26. PLEASE BRIEFLY DESCRIBE MARION'S PRESENT WATER RATES AND 14 CHARGES.

A. Marion's present water rates and charges are the same for all customers on a monthly basis.
Each hundred cubic feet (CCF) of water used is charged through a four-tier declining block
structure shown on the next page.

	Rate per CCF
Tier 1: 0 - 1.33 CCF	\$3.96
Tier 2: 1.34 - 6.67 CCF	\$3.43
Tier 3: 6.67 - 100 CCF	\$1.95
Tier 4: Over 100 CCF	\$1.30

1

4

5

Each user presently pays a minimum charge based on a quantity of water defined for each meter size as shown below and applied to the declining block rate structure. Water use

above the minimum usage is charged according to the block rate structure.

Meter Size	Minimum Usage (CCF)
5/8"	3
3/4"	5
1"	10
1 1/2"	19
2"	37
3"	81
4"	200
6"	328
8"	457

Moreover, customers are charged a separate rate for public fire protection on a monthly 6 basis based on the size of their water meter. Private Fire Protection charges are assessed 7 on an annual basis to customers with private hydrants and sprinkler systems. Customers 8 are charged \$413.06 annually for each private hydrant and \$0.43 per sprinkler head. 9 PLEASE EXPLAIN HOW THE COST OF SERVICE RESULTS WILL BE USED 27. 10 IN CONSIDERING THE RATE STRUCTURE AND PROPOSED RATES AND 11 CHARGES. 12 A basic premise in establishing fair and equitable rates is that rates should reflect the 13 A. proportional cost of providing service to each customer class. An equitable rate structure 14 will recognize these differences and reasonable charge those classes for the costs incurred. 15 Rate design efforts use the cost of service results as a guidepost when creating rates and 16

charges, but other factors are also considered, such as customer impacts, affordability, and conservation. As such, the proposed rate schedules were developed in consideration of the proposed phased approach for revenue requirements, while attempting to mitigate customer impacts for all customer classes where possible. Moreover, the proposed rate structure is intended to enhance transparency, allow customers to have more control on their bill by paying for what they use, and also provide a greater price incentive for water conservation by establishing a uniform rate as opposed to a declining block rate structure.

8 28. PLEASE DESCRIBE THE <u>PETITIONER'S EXHIBIT 15</u>.

- 9 A. <u>Petitioner's Exhibit 15</u> consists of schedules representing the various steps in the rate
 10 design process:
- Schedule 1 Water Customer Charge illustrates the calculation of the proposed customer
 charge based on the results of the cost of service analysis. This charge is intended to capture
 the costs associated with the customer function equally per bill.
- Schedule 2 Water Unit Rates shows the calculation of an effective unit rate per CCF for each customer class based on the net cost to service each class for Phase I (after consideration of revenue that will be recovered in the customer charge and public fire protection charge) and the annual billable units for each class. This schedule supports the rationale for a single system wide uniform rate per CCF.
- Schedule 3 Fire Protection Rates shows the calculation of fire protection charges based
 on the Phase I cost of service results from Schedule 9 in <u>Petitioner's Exhibit 14</u>.
- 21 Schedule 4 Phased Rate Plan and Projected Revenues displays the schedule of rates and
- 22 charges over the 5 Phase revenue requirements. Further testimony will detail the guidelines

- used to develop this rate plan, which gradually implements the cost of service results over
 the period to mitigate customer impacts.
- Schedule 5 Multi-Year Schedule of Rates and Charges by year for each phase of the
 proposed revenue requirements.
- Schedule 6 Example customer impacts based on different combinations of meter size and
 usage levels based upon Phase I and Phase V rates per Schedule 5.

7 29. PLEASE DESCRIBE THE GUIDANCE USED TO ESTABLISH PROPOSED 8 RATES WHILE MOVING TOWARD COST OF SERVICE RATES?

Changes in revenue recovery are needed for all customer classes; however, some of the 9 A. needed changes in certain customer classes are significant. For example, the Industrial 10 customer class needs to increase revenue by 77.5% to meet its Phase I revenue 11 requirements alone. To minimize customer impacts and allow customers time to plan for 12 the rate adjustments, indicated cost of service adjustments are being implemented over time 13 in a manner consistent with the five phases of revenue requirement adjustments proposed 14 The following rate design criteria were followed to balance the competing 15 by Crowe. interests of achieving cost-based rates and mitigating rate impacts: 16

17 1) The intent was the spread the cost of service adjustments to the customer classes with 18 the greatest impact as equally as possible over each of the phases. Additionally, another 19 goal was to limit the maximum increase for any class to 1.5 times the overall revenue 20 increase proposed by Crowe for each respective phase. For example, Crowe proposed a 21 16% revenue increase overall in Phase I. Under this approach, the maximum increase that 22 any individual class of customers could realize in Phase I is approximately 23%. In Phase 23 I, the customer impact goal was satisfied for all customer classes. However, in attempting

Verified Direct Testimony of Andrew Burnham <u>Petitioner's Exhibit 12</u> City of Marion, Indiana Page 26 of 29

to have a consistent level of annual increases for each class that is also consistent with the
level of overall revenue requirement increases by phase, an increase of about 2 times the
overall revenue increase is required for some classes (institutional and industrial) in
following phases, as shown in Schedule 4 in <u>Petitioner's Exhibit 15</u>. A summary of the
annual revenues and increases by class are shown below.

01 \$2,911,70 9.2% 78 \$911,492 13.1% 52 \$293,862 19.7%	17 \$3,121,433 7.2% 2 \$1,027,512 12,7% 2 \$352,676 20.0%	\$3,321,631 6.4% \$1,132,406 10.2% \$411,476 16.7%	\$3,493,228 5.2% \$1,245,523 10.0% \$482,710 17.3%
9.2% 78 \$911,492 13.1% 52 \$293,862 19.7%	7.2% 2 \$1,027,512 12,7% 2 \$352,676 20,0%	6.4% \$1,132,406 10.2% \$411,476 16.7%	5.2% \$1,245,523 10.0% \$482,710 17.3%
78 \$911,492 13.1% 52 \$293,862 19.7%	2 \$1,027,512 12,7% 2 \$352,676 20.0%	\$1,132,406 10.2% \$411,476 16.7%	\$1,245,523 10.0% \$482,710
13.1% 2 \$293,862 19.7%	12,7% 2 \$352,676 20,0%	10.2% \$411,476 16.7%	10.0% \$482,710 17.3%
2 \$293,862 19,7%	2 \$352,676 20.0%	\$411,476 16.7%	\$482,710
19.7%	20.0%	16.7%	17 3%
6658 220			11.378
\$656,220	\$766,141	\$866,961	\$983,327
16.2%	16.4%	13.2%	13.4%
5 \$198,565	\$198,565	\$198,565	\$200,253
0.0%	0.0%	0.0%	0.9%
16.0%	16.0%	16.0%	16.0%
5	16.2% 5 \$198,565 0,0% 16.0%	16.2% 16.4% 5 \$198,565 \$198,565 0.0% 0.0% 16.0% 16.0%	16.2% 16.4% 13.2% 5 \$198,565 \$198,565 \$198,565 0.0% 0.0% 0.0% 16.0% 16.0% 16.0%

In Phase V, the revenues collected from each customer class are expected to be closely 7 aligned with the cost to serve each class. The chart on the next page shows the Phase V 8 revenue requirements for each class and in total as compared to the projected Phase V 9 revenues from each class and in total based upon the recommended rate schedules. Phase 10 V cost to serve each class is calculated by applying the ratio of the test year cost to serve 11 each class for Phase I to the total test year revenue requirements for Phase V. Phase V 12 projected revenues are calculated by applying the Phase V proposed rates to the billable 13 units in each class from the test year. Projected revenues for each class in each phase are 14 shown in Schedule 4 in Petitioner's Exhibit 15. 15

6

Verified Direct Testimony of Andrew Burnham <u>Petitioner's Exhibit 12</u> City of Marion, Indiana Page 27 of 29

1

2

3

4

5

6

7

8

2) In instances where a current rate was above the Phase I cost of service results, the rate was either frozen until such as time when the actual cost caught up or exceeded the current rates based upon the future phases of revenue requirement increases (private fire protection) or increased modestly to establish a more level plan of annual increases consistent with the proposed future revenue requirement increases (public fire protection). This avoids unnecessary rate fluctuations due to decreases followed by future increases. This also helps to offset the lost revenues occurring due to the limit set in item 1) above.

9 3) Eliminate the minimum use per meter size in the rate structure. The minimum use
10 charge reduces the customer's ability to control their bill. Elimination of the minimum use
11 provides increased affordability for lower volume users and serves to charge customers for
12 the water that they use.

4) Eliminate the declining block rate structure over the five-phase implementation.
Elimination of the declining block rate will provide equity between customers as each unit
of water will be charged the same rate (which is consistent with current unit rate

	calculations by customer class). This gradual change will allow time for customers to
	prepare and adjust water use, if applicable, and mitigate some rate shock.
	5) Implement a Customer Charge per bill set to recover costs associated with providing
	accurate billing and customer service to customers. This charge is unrelated to the amount
	of water used and recovers costs that are incurred to accurately bill and provide customer
	service equally to all customers. Schedule 1 in Petitioner's Exhibit 15 shows the
	calculation of the Customer Charge for Phase I. Customer function costs are divided by
	the total number of annual bills to determine the monthly customer charge for all water
	customers.
30.	HAVE YOU PREPARED A SCHEDULE OF PROPOSED RATES AND
	CHARGES?
	Yes, Schedule 5 in Petitioner's Exhibit 15 presents a comparison of the current rates and
	charges to the proposed rates and charges for each phase of the proposed revenue
	requirements.
31.	HAVE YOU CONSIDERED INDIVIDUAL CUSTOMER BILL IMPACTS AS
	PART OF THE PROCESS TO DEVELOP THE PROPOSED RATES AND
	CHARGES?
	Yes, bill impacts for all customers were calculated for Phase 1 adjustments. Given the
	changes to the rate structure and the needed revenue increases there are a wide range of
	impacts. Generally, customers with low consumption compared to the minimum usage
	assigned to the meter size in the current structure will see a decrease or slight increase in
	the monthly bill with the elimination of the minimum use. Large customers can see a more
	significant increase in their bill as the declining block rate is eliminated over time.
	30.

1		A summary of sample bill analysis performed for the Phase I revenue requirements as well
2		as Phase V was presented to Marion and is included on Schedule 6 in Petitioner's Exhibit
3		<u>15</u> .
4	32.	DOES THIS CONCLUDE YOUR PRE-FILED DIRECT TESTIMONY AT THIS
5		TIME?
6	A.	Yes.

VERIFICATION

I affirm under the penalties for perjury that the foregoing testimony is true to the best of my knowledge, information, and belief.

Cef. M

Andrew Burnham

CERTIFICATE OF SERVICE

I certify that a copy of the foregoing was served upon the following by electronic mail this $lo^{\frac{1}{2}}$ day of January, 2023:

Indiana Office of Utility Consumer Counselor infomgt@oucc.in.gov

) Jenak

4487465_3

Petitioner's Exhibit 13

Andrew Burnham

Vice President

Mr. Burnham is the Vice President and Global Practice Leader of Financial Services at Stantec. Andy has extensive experience in conducting as well as overseeing cost of service allocations, integrated financial planning and affordability analyses, and development of alternative rate and fee structures for a variety of utility systems, including water, wastewater, reclaimed water, stormwater, solid waste, recycling, electric, and natural gas. He has been recognized as an industry expert as part of providing testimony in utility rate-related regulatory proceedings in multiple states and territories (including Florida, Michigan, Arizona, and the United States Virgin Islands), as well as before the Federal Energy Regulatory Commission. He has led over 500 studies for 150+ communities, and has supported the issuance of \$1 billion of bonds for projects in the past 5 years.

Mr. Burnham is currently serving on multiple AWWA and WEF Committees, and was actively involved in the recent update to AWWA Manual M1 – Principles of Water Rates, Fees and Charges, notably in regards to outside-city retail rates, wholesale rates, and reuse rates. In addition, Andy led the development of the Cash Reserve Policy Guidelines Report recently published by the AWWA.

EDUCATION

Bachelors of Business Administration, Lake Superior State University, Sault Ste. Marie, Michigan, 2000

MEMBERSHIPS

Trustee of the Management & Leadership Division, American Water Works Association

Member, Utility Resource Management Committee, The National Association of Clean Water Agencies

Member, Florida Section, Government Finance Officers Association

Rates and Charges Committee, American Water Works Association Financial Accounting & Management Controls Committee, American Water Works Association

Management Committee, Water Environment Federation

PROJECT EXPERIENCE

WATER RESOURCES

Western Area Water Authority | North Dakota

Andy is serving as the Project Manager on a financial feasibility study for the Authority as required by the 2017 legislature. As part of the study, our team quantified the amount of excess capacity available on a locational basis to evaluate the potential of firm and interruptible service offerings that would effectively change the Authority's primary role to more of a pure wholesaler of water to local private water companies. The study incorporated potential revenue from a new concession-based business model, with the intent of stabilizing cash flows and achieving financial sustainability to support continued domestic rural water supply in the region.

James City Service Authority | Virginia

Andy was the Project Manager for a comprehensive rale study for the Authority. He led the development of rate structure modifications that ensured the Authority's rates conformed to accepted industry practice and reflected the appropriate distribution of system costs, while achieving its policy objectives, of fiscal stability, affordability, and conservation. In light of declining demands, the Authority had significant concerns relative to its ability to recover a portion of the fixed costs of the system, so we developed a two-part rate structure inclusive of a fixed monthly readiness-to-serve charge and inclining block water conservation rates. We also evaluated the Authority's system and local facilities charges to ensure they recovered the initial cost of capacity for infrastructure utilized to serve new connections in the future.

City of Cleveland - Water and Wastewater Cost of Service Study | Cleveland, Ohio | Project Director

Andy oversaw all work completed during this comprehensive cost of service and rate study for the City's water and wastewater utilities. He provided guidance relative to the development of alternative tenyear financial management plans, reserve policies, and capital funding strategies. Andy also directed the completion of benchmarking activities relative to infrastructure spending for underground assets.

TOHO | Florida | Technical Advisor

Andy recently served as technical advisor for a reclaimed water cost of service and rate design for the Authority. The study included a detailed cost allocation analysis that evaluated the current level of cost recovery from existing rates and examined alternative rate designs for the Authority, including the resulting impacts to retail and bulk customers. The Authority adopted the recommendations developed during the study, which included modifications to provide a consistent level of cost recovery amongst all customer classes and a modified retail reclaimed water rate structure that is consistent with its potable water rate structure.

JEA, Jacksonville | Florida | Project Manager

Mr. Burnham has served as our project manager for multiple studies with the JEA, including 1) understanding the forms of business organization being applied to the sewer business, and practices used in the industry for conversion of septic tanks to central sewer service, 2) identifying the costs associated with treatment of landfill leachate from the City of Jacksonville to support new service rates, and 3) a comprehensive cost of service and rate design study to support the update of all fees and charges using more detailed data (including hourly customer metering data) and granular approaches intended to result in enhanced equity, transparency, conservation, and affordability of service to its diverse customer base.

Town of Front Royal | Virginia | Project Manager

Mr. Burnham served as project manager for a water and sewer comprehensive cost of service and rate study and subsequent updates to the initial study. He used our FAMS-XL model to develop a ten-year financial management plan and plan of annual rate adjustments to meet all of the utility's financial obligations in each year of the projection period. Mr. Burnham developed three alternative conservation rate structures for consideration that would recover the identified cost of service from the financial management plan and prepared customer impact analyses for each alternative. The analysis also included the review of and updates to current outside-town rate differentials.

Diamondhead Water & Sewer District | Diamondhead, Mississippi | Project Manager

Mr. Burnham served as the project manager for a comprehensive cost of service for the District. During the study, we provided updates to the water and sewer rales, taking into account capital funding challenges resulting from FEMA reimbursement delays. Mr. Burnham has also managed the preparation of a Bond Feasibility Report and a benchmarking analysis in which we compared the District's operations to industry standards and local entilies.

Orange County | Florida | Project Manager

Mr. Burnham has served as the project manager or a lead consultant for the County for over 15 years. During that time, he has conducted several revenue sufficiency analyses to ensure adequate revenue to meet projected cost requirements, periodic water and wastewater impact fee studies, water and sewer rate structure analysis, reclaimed water cost of service study and presentations of the results to management, elected officials and other stakeholders. In addition, he led a bond feasibility study for the County including preparation of a bond report. The recommendations from our services have generally been implemented and the utility has been able to maintain a very good credit rating with low rates and annual rate adjustments.

Town of Cary | North Carolina | Project Manager

Mr. Burnham served as the project manager for a Bond Feasibility Study for the Town which included the development of a Financial Model. During the study, Mr. Burnham led the development of a multi-year financial forecast using our FAMS-XL model. He developed a capital financing plan that included alternative funding options to minimize the rate impacts on existing rate payers as well as to comply with existing bond covenants. He worked closely with staff to prepare a bond feasibility report consistent with prior reports, modified based upon his experience.

Marion County | Florida | Project Manager

Mr. Burnham has served as the project manager for the County for over ten years. During this time, he has managed a variety of initiatives including multiple water, wastewater, and irrigation revenue sufficiency analysis to ensure adequate revenues to meet projected cost requirements; development of inclining block rates, as well as a plan for common rate structure through the County which combined five disparate rate districts into one common inclining block rate structure; and development of a detailed customer impact analysis to demonstrate the impact of the new rate structure upon the cost of service to all customers classes in each rate district.

City of Greenfield | California | Project Manager

Andy served as project manager during the conduct of a longoverdue comprehensive water and wastewater rate study for Greenfield. Rates were designed to fund the utility's projected costs of providing service while proportionally allocating costs among customers, providing a reasonable and prudent balance of revenue stability, and complying with the substantive requirements of California Constitution Article XIII D, Section 6 (Prop 218).

Pasco County | Florida | Project Manager

Andy was the project manager for the County's water, sewer & reclaimed water rate study. The study included a five and ten-year revenue sufficiency analysis during which he reviewed alternative capital improvement funding sources, target debt service coverage levels, levels of operating and capital reserves, and other financial policies/goals that affect the financial performance of the utility systems and future revenue requirements. He analyzed their financial goals and objectives and scenarios regarding alternative capital improvement spending programs, cost escalation factors, levels of impact fees and miscellaneous charges, changes in usage patterns, and elasticity of demand in response to rate increases and conservation measures.

Orange Water & Sewer Authority | North Carolina | Project Manager

Mr. Burnham has served as project manager for OWASA for water.

wastewater, and reclaimed water financial consulting services for nearly ten years. He has conducted several studies including several long-term financial plans, detailed cost allocation to support rate design, evaluation of affordability for low-income users, and bond feasibility studies.

City of Chesapeake | Virginia | Project Manager

Mr. Burnham served as the project manager for a comprehensive cost of service rate study, during which we 1) developed an updated multi-year financial forecast and plan of annual rate adjustments, 2) evaluated peak demands and cost allocations by customer class, 3) assessed the customer impacts of alternative rate structures by class of customer, 4) updated specific service charges and connection fees, 5) reviewed billing practices and made recommendations for improvements, and 6) provided customized modeling tools for the City's future use. The study culminated in the City's successful transition from a single rate structure for all customer classes to different rates and rate structures for each defined customer class.

Pere Marquette Township | Michigan | Project Manager

Mr. Burnham served as project manager for the Township in negotiating their wholesale water supply rate with their provider. After lengthy negotiations, the parties agreed to a rate structure which reduced the Township's purchased water costs and provided incentive for the attachment of a major user to the Township's system. Once purchased water costs were finalized, expected revenues reflecting the new customer addition, operating, debt, and capital costs were developed for the Township. This allowed the Township to examine the future sustainability of their operations. Water and sewer rate recommendations were presented to the Township's Board,

City of Punta Gorda | Florida | Project Manager

Andy conducted a comprehensive water and wastewater rate study involving the development of: a long-term financial plan of annual rate adjustments, full-cost recovery impact fees for consideration, and rate structure modifications of both the tiers and block rates to encourage conservation. Andy assisted the City by providing a detailed cost-of-service analysis which isolated water and sewer service costs. He also developed and updated several miscellaneous fees which included: fire protection fees, treated water rates, and irrigation rates. As part of the study, he identified the drivers of rate adjustments and their impacts to various customer types and presented the results to management and elected officials.

City of Denton | Texas | Project Manager

Andy led a comprehensive cost of service and rale design study for the City's water and sewer utilities. The study included the development of a ten-year financial management plan, including identification of annual rate increases, amount and timing of required borrowing to fund the capital improvement program, establishment of proper reserve levels, and maintenance of adequate debt service coverage levels. An important component in the financial management plan for the City was a rate stabilization reserve to address the issue of revenue volatility due to weather conditions and demand reductions.

City of Venice | Florida | Project Manager

Mr. Burnham has served as project manager for the City since 2012. He managed a comprehensive water and sewer rate study during which he utilized our FAMS-XL model to evaluate the adequacy of the revenue provided by the Utility's current rates and charges, and he also reviewed the Utility's current rate structure and developed modifications based upon legal precedent, conformance to accepted industry practice, an equitable distribution of costs. promoting resource conservation, and customer impact objectives. He led a series of work sessions with a Stakeholder Work Group, comprised of representatives from the community, which unanimously endorsed our recommendations, and were approved by the City Council.

Henrico County | Virginia | Project Manager

 Mr_{\ast} Burnham served as the project manager for a rate study detailing revenue requirements, cost of service allocations, financing

alternatives, and recommended rates and fees. The Study included a ten-year projection of all operating costs and capital improvement costs and the determination of the annual revenue required to support those costs. Notably, he reviewed and made recommendations regarding cost of service studies that were prepared by the County related to purchased water from other entities in the area.

City of Naples | Florida | Project Manager

Andy served as the project manager for the City's comprehensive water and sewer rate study. Andy worked with City staff to customize a multi-year financial forecasting model. He also reviewed the current water and sewer rate structures and developed modifications to ensure the City's rates conformed to accepted industry practice and reflected the appropriate distribution of system costs, while providing cost incentive to encourage water conservation.

Brunswick-Glynn County Joint Water & Sewer Commission | Georgia | Project Manager

Mr. Burnham has 1) developed annual ten-year financial management plans for the water and sewer systems within the JWSC's two districts, 2) prepared loan and bond feasibility reports, 3) calculated updated water and sewer capital tap fees (impact fees) for each district, 4) calculated public and private fire protection charges, 5) developed a uniform conservation rate structure for its two service districts, and 6) prepared a detailed rate manual that explains the purpose, intent, and structure of all its rates, fees, and charges.

City of St. Petersburg | Florida | Project Manager

Mr., Burnham has served as project manager for the City for over 10 years of annual water, sewer and reclaimed water rates studies, Annually, he manages an update to the multi-year financial plan, detailed cost allocation analyses of the water, wastewater and reclaimed water costs and evaluation of rate structures. He has also providing litigation support for the City along with support in the issuance of revenue bonds,

FINANCIAL SERVICES AND MANAGEMENT

Western Area Water Authority | North Dakota | Project Manager

Andy served as the project manager on a financial feasibility study for the Authority as required by the 2017 legislature. As part of the study, our team quantified the amount of excess capacity available on a locational basis to evaluate the potential of firm and interruptible service offerings that would effectively change the Authority's primary role to more of a pure wholesaler of water to local private water companies. The study incorporated potential revenue from a new concession-based business model, with the intent of stabilizing cash flows and achieving financial sustainability to support continued domestic rural water supply in the area.

City of Ann Arbor | Michigan | Project Manager

Mr. Burnham led a detailed cost of service study that evaluated multiple forecasts of revenue requirements and rate adjustments with stakeholders under a variety of assumptions and capital funding strategies. As part of the study, we analyzed the City's available data, customer usage patterns (on a monthly, daily, and hourly basis) past studies, and objectives to determine appropriate customer classes. cost of service methodologies, and rate structures that satisfied annual revenue requirements, adhered to cost of service, promoted conservation, and enhanced affordability. Notably, our review of available data led to the creation of a cost-based tiered rate structure and creation of a new multifamily rate classification.

City of Clearwater | Florida | Project Manager

Mr. Burnham has served as project manager for the City's annual water, sewer, reclaimed water, solid waste, and recycling and stormwater rate studies. Each year, he oversees a detailed analysis of historical customer demand data, including the development of multi-year projections of the same based upon current economic and environmental conditions. As part of each study, a multi-year

financial forecast and rate adjustment plan is developed for each utility. Mr. Burnham also developed rate structures for the City that ensure fair and equitable rates and conformance to accepted industry practice and legal precedent. Each study included presentations of the results to City management, elected officials, and stakeholders.

City of Olathe | Kansas | Project Director

Andy served as the project director for a Comprehensive Utility Rate Study for the City. For each service – including Solid Waste, Water, Sewer, and Stormwater – we developed customized financial models including ten-year financial plans and identification of alternative plans of rate adjustments, reviews of alternative capital spending and operational scenarios, and other sensitivity analyses. Andy provided guidance to support the detailed cost allocation analyses for each fund, and development of alternative rate structures to ensure the City is charging fair and equilable rates for each service.

Union County, North Carolina | Project Manager

Mr. Burnham has served as project manager for the County's water & sewer financial planning model and bond feasibility study. He developed the financial planning model to simulate the utility system's particular financial dynamics over a 10-year planning horizon, including the specific financial structure and flow of funds associated with the Bond Feasibility Study.

Pinellas County | Florida | Project Manager

Andy has served as the project manager for the County for nearly ten years, including a comprehensive Water, Wastewater and Solid Waste Rate Study and several annual updates. During these studies, Mr. Burnham has used our FAMS-XL model to develop ten year financial plans for the water, sewer and solid waste enterprise funds. He has also conducted a benchmarking analysis, assisted County staff in evaluating the underlying cost of operations, and conducted detailed cost allocation and overhead studies for the Utilities Department.

City of Tempe, Arizona | Project Manager

Mr. Burnham served as the project manager on a recent Water and Sewer Rate Study for the City. The study included the development of several alternative multi-year financial plans and corresponding plans of annual rate adjustments. We also completed a detailed cost of service allocation analysis and rate design study, which resulted in recommendations for adjustments to enhance specific linkages to cost of service, and consider reasonable irrigation for larger lots sizes while continuing to provide alfordability and conservation pricing for excessive use. Finally, we participated in multiple special-purpose stakeholder meetings to educate the community on the process and the new rate structure.

Water and Wastewater System Advisory | Nashville, Tennessee | Project Manager

Andy has served in multiple advisory roles to the District to address complex issues related to its multi-jurisdictional water and wastewater system. One of his first assignments was to customize a financial planning model to reflect the District's operations. He also worked collaboratively to create a financial forecasting tool in alignment with the current budgeting and capital planning processes.

Town of Gilbert | Arizona | Project Manager

Andy served as the project manager for a comprehensive Water, Sewer, Reclaimed Water, Environmental Services (Sanitation), and Stormwater Rate Study (Study) for the Town. As part of the study, for each utility system, we performed a revenue sufficiency analysis, detailed cost of service allocation, and rate structure analysis. We developed several modifications to the Town's existing rate structures, notably including a new inclining block water rate structure. Mr. Burnham also completed a cost allocation study for the wastewater system and a stormwater rate program feasibility study.

STORMWATER

City of Bismarck | Bismarck, North Dakota | Project Manager

Andy served as the Project Manager to lead the City in its comprehensive Water. Wastewater and Stormwater Rate Study. During this studies, Andy and our team helped City staff bring stakeholders together in evaluating solutions for rate structure and implementation plan recommendations. The project included justifying customer classifications with the use of AMI billing data, and detailed cost allocations in support of significant changes to customers' utility rates.

City of St. Petersburg - Water Resources Rate Studies | St. Petersburg, Florida, United States | Project Manager

Mr. Burnham created an innovative, data-driven method to understand the impacts of implementing a lier-based rate structure. Specifically, the method captured the impervious area for about 1,300 residential properties, and ensured that the properties included in the sample were consistent with the residential property size distribution of the full City. The percentage of impervious area to parcel size from the sample was applied to all residential parcels to establish an estimated impervious area database for creating a liered structure and evaluating customer impacts. He then employed a novel data visualization approach that allowed for onthe-fly changes to the rate structure and real time GIS feedback, including a map illustrating the location of residential parcels and bill impacts. In this transparent and consensus-building way, The City and its stakeholders were able to see the likely impacts of alternative residential tier-based rate structures prior to proceeding with a very different fee schedule.

Stormwater Rate and Service Assessment | Ann Arbor, Michigan | Project Manager

Andy reviewed the level of service being provided in this comprehensive stormwater rate and level of service assessment. He looked at multiple areas and identified alternative options along with their corresponding cost and rate implications. Additionally, Andy conducted a series of interactive work sessions with representatives of various customer groups within the community to prioritize the identified level of service enhancements.

City of Columbia | Missouri | Project Manager

Andy managed a comprehensive stormwater and sewer cost of service rate studies for the City. He performed a revenue sufficiency analysis in order to develop a multi-year plan of rate revenue increases to satisfy the annual operating, debt service, and capital requirements of each utility as well as maintain adequate operating reserves. He then reviewed the rate structure (including evaluation of rates for wholesale users), and developed recommended modifications to ensure that the rates conformed to accepted industry practice and reflect a fair and equitable distribution of system costs.

City of North Port | Florida | Project Manager

Andy managed the development of an alternative cost apportionment methodology and resultant alternative road and drainage (stormwater) assessments for the City. The methodology focused on the drainage portion of the assessment, but also included a detailed apportionment of costs to the road, mowing, and drainage functions. We obtained relevant parcel data and developed compilation programs to facilitate calculation of assessments using the alternative cost apportionment methods evaluated. He has conducted periodic updates to the assessment,

AGENCY/STATE	PROJECT DESCRIPTION	YEAR
Arizona	Testimony in Docket No. WS-01303A-02-0867, et. al before the Arizona Corporation Commission on behalf of the Town of Youngtown relative its utility provider's proposed increase in revenue requirements and rate adjustments.	2003
Delaware	Direct and rebuttal reports as well as deposition before the American Arbitration Association in Case No. 01-19-0000-8779 on behalf of the City of Wilmington relative to the basis and methodology employed by the City in allocating wastewater treatment costs and establishing wholesale sewer rates.	2021
Federal Energy Regulatory Commission	Testimony in Docket No. ER03-574-000, et. al, relative to appropriate cost of service allocations and pricing of short and long-term electric transmission service within and between regional transmission organizations, including utility revenue sharing mechanisms.	2003
	Testimony in Docket No.: 04-0007-0011-0001 before the St. Johns County Water & Sewer Authority relative to the calculation of additional water rate revenue required to recover the return of and on water plant investments on behalf of a private, investor-owned utility (Intercoastal Utilities, Inc.).	2004
Florida	Affidavit and deposition in Case No. 8:09-CV-01317-T-33MAP before the United States District Court, Middle District of Florida, Tampa Division on behalf of the City of St. Petersburg, Florida relative to the basis and methodology employed by the City in setting its wholesale sewer rates.	2009
	Affidavit in Case No. 12-3155-CAB before the Fifth Judicial Circuit Court in and for Marion County in support of the acquisition of and rate structure for a private water and sewer system on behalf of the City of Dunnellon.	2013
	Testimony in Case No. CACE22013802 before the Seventeenth Judicial Circuit Court in and for Broward County in support of the cost allocation methodology and capital funding plan for the stormwater management system on behalf of the City of Fort Lauderdale.	2022
Indiana	Rebuttal testimony in Cause No. 45533 before the Indiana Utility Regulatory Commission on behalf of the City of Bloomington relative to cost of service and rate design aspects of proposed water rates and charges.	2021
	Affidavit in Case No. U-13739 before the Michigan Public Service Commission on behalf of Consumer Energy in regards to the classification of electric transmission and distribution facilities of a service provider.	2003
Michigan	Direct and rebuttal testimony in Case No. U-13917 before the Michigan Public Service Commission on behalf of Consumer Energy in regards to electric transmission cost forecasting, rate structures and service types, current wholesale industry trends, and appropriate cost recovery mechanisms for local distribution companies.	2004
	Testimony in File No. 15-5343-AW before the Circuit Court of Lenawee County, Michigan on behalf of Gaslight Village Assisted Living, LLC in regards to the proper level of connection and benefit fees for Adrian Township applicable to the assisted living facility and other customers	2016
	Testimony in File No.: 14-006077-CK before the 26th Circuit Court for the County of Alpena, MI on behalf of Alpena Township as to appropriate water and sewer rates for service provided by the City of Alpena to the Township.	2018

Minnesota	Affidavit in Court File No.: 62-CV-18-2356 before the 2 nd District Court for the County of Ramsey, MN on behalf of the City of Saint Paul, Board of Water Commissioners, and Saint Paul Regional Water Services regarding the appropriate application of and methodology for calculating base fees and right of way recovery fees.	2019
United States Virgin Islands	Testimony in Docket No. 554 before the Government of the U.S. Virgin Islands Public Service Commission relative to the establishment of a wastewater user fee on behalf of the Virgin Islands Waste Management Authority. The testimony presented the basis for and methodology employed in calculating the user fee and supporting data.	2007

	ne Function		Treatment ¹		customer 3		· vvater system Demands (MGD)	Coincident (System) Peaking Factors ⁴	Max Month to Max Day Factor ⁵	Water Production Flows ⁶										

¹ Treatment Costs are assigned the Base and Max Day Function based on ratio of the Max Day to Average Day Demands.

² Distribution Costs are allocated to Base, Max Day, and Max Hour Demands. The Base component is a ratio of the average day demands to the max hour demands. The max day component is the difference between the max day and average day demands divided by the max hour demands. The remainder is assigned to the max hour.

³ Customer costs are assigned directly to the customer cost component.

⁴ Coincident (System) Peaking Factors based on 3 year average (2019-2021). Max Day (MGD) divided by Avg Day (MGD). Peak Hour (MGD) divided by

⁵ Max Month to Max Day factor based on 3 year average (2019-2021). Max Day(MGD) divided by Max Month (MGD). ⁶ Source: Water Production Data.xls provided by Marion.
