STATE OF INDIANA

PRE-FILED VERIFIED DIRECT TESTIMONY

OF

SCOTT C. WEAVER

ON BEHALF OF

INDIANA MICHIGAN POWER COMPANY

**PRE-FILED VERIFIED DIRECT TESTIMONY OF SCOTT C. WEAVER
ON BEHALF OF
INDIANA MICHIGAN POWER COMPANY**

I. INTRODUCTION

1 **Q. WOULD YOU PLEASE STATE YOUR NAME, BUSINESS ADDRESS, AND**
2 **POSITION?**

3 A. My name is Scott C. Weaver, and my business address is 1 Riverside Plaza,
4 Columbus, Ohio 43215. I am employed by the American Electric Power
5 Service Corporation ("AEPSC") as Managing Director-Resource Planning and
6 Operational Analysis. AEPSC supplies engineering, financing, accounting
7 and similar planning and advisory services to the ten electric operating
8 companies of the American Electric Power System (collectively, "AEP"),
9 including Indiana Michigan Power Company ("I&M" or "Company").

II. BACKGROUND

10 **Q. WOULD YOU PLEASE DESCRIBE YOUR EDUCATIONAL AND**
11 **PROFESSIONAL BACKGROUND?**

12 A. I received a Bachelor of Business Administration Degree in Accounting from
13 Ohio University in 1981, and a Master of Business Administration from the
14 same university in 1985. In addition, in 1996 I completed both the American
15 Electric Power System Management Development Program at The Ohio
16 State University, as well as The Darden Partnership Program at the Darden
17 Graduate School of Business Administration, at the University of Virginia.

18 I have over 35 years of experience with AEP. I was employed by
19 AEPSC in 1980 as an Associate Forecast Analyst in the Controllers

1 Department (now Corporate Planning and Budgeting Department), was
2 subsequently named Assistant Financial Analyst in 1983, Financial Analyst in
3 1986, Senior Financial Analyst in 1987, and Senior Administrative Assistant II
4 in 1990. In 1991, I transferred to the AEPSC Fuel Supply Department as
5 Manager-Administration. I was subsequently named Manager-Administration
6 and Purchasing in 1994 and Director of Power Generation Business Planning
7 and Financial Management in 1996. I transferred to the AEP Wholesale
8 business unit in 2000 as Manager-Business Planning and in January, 2003
9 transferred back to the Corporate Planning and Budgeting Department as
10 Director of Operational Analysis. I assumed my present position in May 2003.

11 **Q. WHAT ARE YOUR RESPONSIBILITIES AS MANAGING DIRECTOR–**
12 **RESOURCE PLANNING AND OPERATIONAL ANALYSIS?**

13 A. I am responsible for the supervision and administration of long-term
14 generation resource planning and supply-side operational analysis for AEP.
15 In such capacity, I coordinate the use of short- and long-term generation
16 production costing and other resource planning models used in the ultimate
17 development of operating and capital budget forecasts for I&M and its parent,
18 AEP, regularly monitor actual performance, and review the preparation of
19 forecasted information for use in regulatory proceedings.

20 **Q. HAVE YOU PREVIOUSLY TESTIFIED BEFORE THIS REGULATORY**
21 **COMMISSION?**

22 A. Yes. I offered testimony before this Commission in 2013 on behalf of the
23 Company in Cause No. 44331, which sought a certificate of public
24 convenience and necessity (“CPCN”) for the installation of dry sorbent

1 injection ("DSI") technology and associated equipment at the Company's
2 Rockport Plant. Most recently, I offered testimony on behalf of I&M in Cause
3 No. 44523; which also sought a CPCN for the installation of selective catalytic
4 reduction ("SCR") technology for Rockport Unit 1. In addition, over the last ten
5 years I will have offered resource planning-related testimony on behalf of AEP
6 operating company affiliates before eight other state commissions: Arkansas,
7 Kentucky, Louisiana, Michigan, Oklahoma, Texas, Virginia, and West Virginia.

III. PURPOSE OF TESTIMONY

8 **Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY IN THIS FILING?**

9 A. The purpose of this testimony is to present economic analyses performed on
10 behalf of the Company regarding installation of SCR technology on Rockport
11 Unit 2. In particular, my testimony will:

12 1) evaluate the cost and feasibility of an option to retire and replace
13 Rockport Unit 2, an assessment required by Ind. Code § 8-1-8.7-
14 3(b)(7);

15 2) describe the modeling process undertaken to evaluate the relative
16 economics of the alternative Rockport Unit 2 disposition options,
17 including a discussion around the major input parameters and key
18 drivers; chief among them the anticipated long-term price of natural
19 gas and energy as well as carbon dioxide ("CO₂") that could impact
20 the Rockport Unit 2 dispatch priority, an assessment required by
21 Ind. Code § 8-1-8.7-3(b)(8);

22 3) affirm that the analysis undertaken assessing these Rockport Unit 2
23 disposition options is consistent with I&M's 2015 Integrated
24 Resource Plan ("IRP") submitted to this Commission on November
25 2, 2015; and

1 4) discuss the results of these economic modeling analyses and the
2 determination that a near-term decision to retrofit Rockport Unit 2
3 by December 31, 2019 with SCR technology and associated
4 equipment for the reduction of nitrogen oxides ("NO_x") is
5 reasonable and would further a course of action around this unit
6 that could ultimately save I&M and its customers over \$300 million
7 versus an option that would not perform that retrofit.

8 **Q. ARE YOU SPONSORING ANY ATTACHMENTS?**

9 A. Yes. I am sponsoring the following attachments:

- 10 • Attachment SCW-1 – Overview of resource planning-related criteria
11 considered in the analyses.
- 12 • Attachment SCW-2 – Key long-term fundamental commodity
13 pricing projections used in the analyses.
- 14 • (CONFIDENTIAL) Attachment SCW-3 – Major modeling input costs
15 and operating parameters for unit disposition options.
- 16 • Attachment SCW-4-1 and SCW-4-2 – Summary of Rockport 2 unit
17 disposition alternative economic analyses over the long-term life
18 cycle study period evaluated, all under unique commodity pricing
19 scenarios (Attachments SCW-4A through SCW-4E).
- 20 • Attachment SCW-5 – Summary of Rockport 2 unit disposition
21 alternative analyses results examined over a shorter timeframe
22 which would demonstrate the significant optionality afforded by
23 retrofitting the unit with SCR technology prior to the possible future
24 installation of a dry scrubber by December 2028, or prior to the
25 potential return of the unit to its Lessors by December 2022.
- 26 • Attachment SCW-6 – A comparison of economic analyses that
27 assessed possible Rockport Unit 2 disposition alternatives included
28 in I&M's recently-submitted 2015 IRP.

1 **Q. WERE THESE ATTACHMENTS PREPARED OR ASSEMBLED BY YOU**
2 **OR UNDER YOUR DIRECTION OR SUPERVISION?**

3 A. Yes they were. As I will describe in this testimony, other functional
4 organizations within I&M and AEPSC were involved in this evaluation
5 process. The role I served was one of coordinating the attendant economic
6 modeling effort and, ultimately, validating, documenting, and internally
7 communicating this process and the results.

8 **Q. PLEASE DESCRIBE THE CONTENTS OF ATTACHMENT SCW-1.**

9 A. Attachment SCW-1 offers a broader overview of some of the other resource
10 planning-related criteria that are necessarily introduced and considered as
11 part of this evaluation of alternative options surrounding Rockport Unit 2, but
12 that largely serve as a backdrop. The following direct testimony focuses more
13 specifically on the discrete economic evaluations performed that led to the
14 Company's conclusions and recommendations.

15 **IV. ROCKPORT UNIT 2 DISPOSITION OPTIONS**

16 **Q. WHAT ALTERNATIVES WERE ANALYZED WITH RESPECT TO THE**
17 **DISPOSITION OPTIONS FOR ROCKPORT UNIT 2?**

18 A. As represented on the following **TABLE 1**, two alternative options—with one
19 of those alternatives posing two sub-options—were modeled with respect to
20 I&M's disposition options associated with the Rockport Plant and, specifically,
21 Rockport Unit 2:

TABLE 1

OPTION #1 - Install SCR on Rockport Unit 2

Option #1A: Retrofit Rockport Unit 2 with SCR technology and associated equipment ("Rockport Unit 2 SCR Project") by December 31, 2019, and enter into a Rockport Lease renewal arrangement for Unit 2 that would provide for its continued operation through retirement at the end of the unit's useful life.

With that, for purposes of only this I&M long-term economic evaluation process, assume...

- Rockport Unit 1 retrofit with SCR by December 31, 2017, as planned, and subsequently retrofit both Rockport units with Dry Flue Gas Desulfurization ("DFGD") technology by December 31, 2025 (Unit 1), and December 31, 2028 (Unit 2); and
- add ash pond, effluent waste-water treatment, and other U.S. Environmental Protection Agency ("EPA")-required equipment and investments at the Rockport Station by approximately the 2019-2021 timeframe.

Option #1B: Retrofit Rockport Unit 2 with SCR technology by December 31, 2019, and return the unit to the Lessor by the December 2022, Rockport Lease termination date.

With that, for purposes of only this I&M long-term economic evaluation process, assume...

- Rockport Unit 1 retrofit with SCR by December 31, 2017, as planned, and retrofit *only* Rockport Unit 1 with DFGD technology by December 31, 2025;
- replace I&M's (85%) ownership/entitlement share of Rockport Unit 2 power and energy with *some combination of* similar-sized, new-build natural gas combined cycle units; natural gas simple-cycle combustion turbine units; aeroderivative units; combined heat and power generation; as well as new renewable (i.e., wind and solar) and incremental demand-side management resources by approximately January 1, 2023; and
- add ash pond, effluent waste-water treatment, and other U.S. EPA-required equipment and investments at the Rockport Station by approximately the 2019-2021 timeframe.

OPTION #2 - Do NOT install SCR on Rockport Unit 2

Option #2: Do not proceed with the Rockport Unit 2 SCR Project, but rather return the Unit to the Lessors by December 31, 2019, before the 2022 termination date in the Rockport Lease.

With that, for purposes of only this I&M long-term economic evaluation process, assume...

- incur payment, according to the terms of the Lease, of the Lease Termination Value effective as of that date;
- retrofit Rockport Unit 1 *only* with SCR by December 31, 2017, as planned, and, likewise, retrofit *only* Rockport Unit 1 with DFGD technology by December 31, 2025;
- replace I&M's (85%) entitlement share of Rockport Unit 2 power and energy with some combination of similar-sized, new-build CC units; CT units; AD units; CHP generation; as well as new renewable and incremental DSM resources by approximately January 1, 2020; and
- add ash pond, effluent waste-water treatment, and other U.S. EPA-required equipment and investments at the Rockport Station by approximately the 2019-2021 timeframe.

Q. WHAT IS THE SIGNIFICANCE OF THE DECEMBER 31, 2019 ROCKPORT 2 UNIT DISPOSITION DATE IDENTIFIED UNDER MODELED "OPTION #2"?

A. December 31, 2019, represents the required retrofit in-service date for the Rockport Unit 2 SCR as set forth within the terms of the Third Joint Modification to the Consent Decree ("Modified Consent Decree"). Based on the testimony of Company witness Hendricks, if the Rockport Unit 2 SCR Project is not installed by that date the unit cannot continue to operate. Hence, as indicated by Company witness Chodak, this condition would necessitate that the Rockport Lease would be terminated, with I&M and AEP Generating Company ("AEG") then obligated to pay the requisite Termination Value as set forth in the Lease. Such Termination Value as of December

1 2019 being estimated at \$715.7 million¹ as provided to me by Mr. Chodak.

2 The specific terms of the Modified Consent Decree, as well as other
3 existing and potential future environmental regulations, are discussed in detail
4 in the testimony of Mr. Hendricks.

5 The Rockport Lease Agreement and its applicable terms and
6 conditions, including end-of-term criteria, are discussed in the testimony of
7 Mr. Chodak.

8 **Q. WHY IS IT PRACTICAL TO CONSIDER, FOR PURPOSES OF THIS**
9 **ECONOMIC ANALYSIS, A SCENARIO (OPTION #1B) WHERE**
10 **ROCKPORT UNIT 2 WOULD ONLY BE AVAILABLE TO I&M FOR THREE**
11 **YEARS AFTER THE INSTALLATION OF SCR TECHNOLOGY?**

12 A. Given the current relative uncertainty of any end-of-lease-term disposition—
13 one that may result in the exercise of an available Lease renewal option—the
14 most reasonable, and least speculative, assumption for purposes of this
15 analytical exercise would be to simply assume the unit would be returned to
16 the Lessors at the Rockport Lease termination date. As explained further by
17 Company witness Chodak this assumption does not preclude the Company
18 from pursuing a Rockport Lease renewal afforded under the Rockport Lease.

19 In sum, Option #1B offers a “worst-case” view of an SCR retrofit “only”
20 scenario, vis-à-vis Option #2 which would not proceed with the Rockport Unit
21 2 Retrofit Project. Option #1B is considered “worst case” because any
22 Rockport Lease renewal would be established under terms that *must* result in
23 more favorable long-term economics than the “Return at Termination

¹ This represents the total estimated Termination Value, with I&M’s “85% (ownership and AEG purchase) share” being \$608.4 million.

1 (December 2022)” option available to the Company under Option #1B as
2 defined. Therefore, in spite of any practical considerations of potentially
3 operating Rockport Unit 2 for a period of only three years after the installation
4 of a major environmental retrofit, Option #1B essentially sets the minimum
5 bound for purposes of determining the economic advantage to I&M’s
6 customers of proceeding with the Rockport Unit 2 SCR Project versus an
7 approach that would *not* install the SCR and require the early termination of
8 the Rockport Lease.

9 **Q. WHAT WOULD BE THE ECONOMIC IMPLICATION OF INVESTING IN AN**
10 **SCR BY DECEMBER 2019, WITH THE POSSIBILITY OF RETURNING THE**
11 **UNIT TO THE LESSOR IN APPROXIMATELY 3 YEARS?**

12 A. For Option #1A and #1B, the modeled cost-recovery period for the capital
13 cost associated with the Rockport Unit 2 SCR Project to be completed in
14 December 2019 was assumed to be 10 years (*i.e.*, by end-of-2029). This
15 period is consistent with the allowable depreciation period under Ind. Code §
16 8-1-2-6.7, as described by Company witness Williamson.

17 However, recognizing in Option #1B that I&M’s potential continued
18 operation of Unit 2 could be limited to the end of the Rockport Lease term, a
19 sensitivity analysis was also performed that would effectively proxy the costs
20 associated with recovery of this retrofit investment by the potential end-of-
21 2022 lease termination date (approximately 3-years). In short, on a
22 cumulative present worth basis, there was only a very minor difference in the
23 overall life-cycle costs of the 2019 Rockport Unit 2 SCR Project if all such
24 investment costs were recovered over the shorter 3-year (versus 10-year)

1 period. In fact, analogous to the typical favorable ‘present value’ economics of
2 a 15-year versus 30-year home mortgage, the full life-cycle economics of the
3 Rockport Unit 2 SCR Project (under Option #1B) would be slightly *improved*
4 by \$28 million if recovered over such a shorter (3-year) timeframe. Therefore,
5 any such potential for accelerated Rockport Unit 2 SCR retrofit cost recovery
6 recognition would not have any significant impact on the *long-term* modeled
7 option results to be discussed.

8 **Q. UNDER “OPTION #1A” YOU INDICATE THE LONG-TERM UNIT**
9 **DISPOSITION EVALUATION PROCESS UNDERTAKEN HAS ASSUMED**
10 **THE *FUTURE* RETROFIT OF DFGD TECHNOLOGY ON ROCKPORT**
11 **UNITS 1 AND 2, AS WELL AS ADDITIONAL FUTURE ENVIRONMENTAL**
12 **INVESTMENTS. DOES THE USE OF THIS ASSUMPTION MEAN THAT**
13 **I&M HAS COMMITTED TO SUCH ADDITIONAL ROCKPORT INVESTMENT**
14 **BEYOND THE ROCKPORT UNIT 2 SCR PROJECT?**

15 **A.** No it does not. It simply offers—for current long-term modeling purposes
16 only—a *potential* unit disposition line-of-sight. Under no circumstance does
17 this option constitute a formal plan or recommendation by the Company for
18 either Rockport unit beyond the nearer-term, Rockport Unit 2 SCR Project.
19 Rather, it merely identifies the “down-stream” retrofit requirements/terms of
20 the Modified Consent Decree as well as additional U.S. EPA requirements.
21 Such EPA requirements include the final Coal Combustion Residuals (“CCR”)
22 rule addressing new and existing CCR landfills and surface impoundments,
23 as well as the final Effluent Limitations Guidelines (“ELG”) rule addressing

1 certain wastewater discharges from power plants; each described by
2 Company witness Hendricks.

3 **Q. WOULD INSTALLATION OF SCR TECHNOLOGY ON ROCKPORT UNIT 2**
4 **BE A REASONABLE APPROACH, EVEN IF I&M ULTIMATELY DECIDED**
5 **NOT TO INSTALL DFGD TECHNOLOGY ON THAT UNIT IN THE**
6 **FUTURE?**

7 A. Yes. To reiterate, the modeling approach taken here was to offer a validation
8 of only the nearer-term “Rockport Unit 2 SCR Project” disposition option.
9 However, by virtue of capturing the current cost and performance parameter
10 estimates associated with *all future* potential retrofit investments for Rockport
11 Unit 2 (and, holistically, all future potential retrofit investments for Rockport
12 Unit 1) as described in TABLE 1-Option #1A; the Company is setting forth a
13 “full picture”—from a long-term economic perspective—of a potential *operate*
14 *Rockport Plant* disposition plan. This modeling exercise would be formally
15 repeated at some point prior to I&M’s commitment to launch into the next
16 phase of this potential long-term disposition (retrofit) plan for the respective
17 Rockport Unit 1 and Unit 2, DFGD projects.

18 **Q. ADDITIONALLY, THE OPTIONS IDENTIFIED IN TABLE 1 SUGGEST THAT**
19 **ROCKPORT UNIT 1 WOULD BE THE EARLIER OF THE UNIT RETROFITS**
20 **FOR DFGD TECHNOLOGY IN THE NEXT DECADE. IS THAT**
21 **NECESSARILY THE CASE?**

22 A. No it is not. In fact, the Modified Consent Decree simply identifies that one
23 Rockport unit would “Retrofit, Retire, Re-power or Refuel” by December 31,
24 2025; and the other by December 31, 2028. It is not specific as to the

1 ultimate unit order. Again, merely for purposes of this modeling exercise it
2 was assumed that Unit 1 would be retrofitted with DFGD by the earlier date.
3 It does not represent a commitment on the part of the Company.

4 **Q. WHY WERE THE “(COAL-TO-GAS) REFUEL” AND “(CC) REPOWER”**
5 **OPTIONS CITED IN THE MODIFIED CONSENT DECREE NOT MODELED**
6 **AS OUT-YEAR ALTERNATIVES?**

7 A. These options were not modeled as out-year alternatives largely due to the
8 fact that, as addressed in the testimony of Company witness Pifer, the future
9 retrofitting of the Rockport units with DFGD would be a more practical and
10 reasonable option—based largely on known engineering and design factors—
11 versus either re-fueling either of these steam units to burn natural gas, or
12 undertaking a major repowering of the units as natural gas CC facilities. That
13 said, any formal assessment of Rockport disposition options to be performed
14 in the future could more fully examine those additional alternatives.

15 **Q. WHAT ARE SOME OF THE OTHER UNDERLYING ASSUMPTIONS FOR**
16 **I&M’S GENERATING FLEET?**

17 A. The following “base” assumptions were utilized for I&M’s Rockport Unit 1,
18 Tanners Creek, D.C. Cook Nuclear, as well as hydro and wind units in each
19 of the alternative options applicable to the Rockport Unit 2 disposition
20 analyses listed in TABLE 1:

- 21 • Rockport Unit 1 was assumed to be retrofitted with SCR by
22 December 31, 2017, as planned (and authorized in Cause No.
23 44523), and DFGD technology by December 31, 2025.
- 24 • Tanners Creek Units 1-4 were retired on June 1, 2015
25 commensurate with I&M’s compliance plan to meet the

requirements of EPA's Mercury and Air Toxics Standards ("MATS") rule.

- Continued operation of D.C. Cook Units 1 and 2 through at least the mid-to-late 2030's.²
- Continued operation of all pre-existing hydro and wind resources; the latter including a new 200 megawatt (MW) wind purchase agreement effective in 2015.
- Assume the 2016 in-service of the I&M solar pilot projects for approximately 15 MW (total) of solar resources.

Again, this is not a definitive commitment to pursue the installation of a Rockport Unit 1 (or Rockport Unit 2) DFGD. Rather, it simply serves as a going-in basis for the long-term modeling process for the "holistic" I&M resource optimization/disposition analysis. Any consideration of potential DFGD retrofits would be made under a separate, future proceeding.

Q. LIKEWISE WHAT WERE THE UNDERLYING ASSUMPTIONS ESTABLISHED FOR THE ROCKPORT UNIT 2 LEASE RENEWAL THAT WOULD BE APPLICABLE TO OPTION #1A?

A. As determined by I&M's management team, for purposes of establishing the economic evaluations for Option #1A, it was assumed that the respective I&M and AEG 50 percent leased shares of Rockport Unit 2 would continue beyond the potential 2022 lease termination date [REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

² This assumption is in-keeping with the D.C. Cook units' current 20-year Operating License Renewal through 2034 (Unit 1) and 2037 (Unit 2). However, no determination has been made by the Company to potentially pursue an additional license renewal beyond these dates.

1 [REDACTED]
 2 [REDACTED]
 3 [REDACTED]
 4 [REDACTED]
 5 [REDACTED]. As such—and as with many of the other
 6 long-term assumptions tied to “Option #1A”—it does not represent the
 7 Company’s potential negotiating position regarding such lease renewal
 8 payments. Rather, it represents a reasonable modeling estimate for purposes
 9 of understanding the potential future cost implications for that option.

10 **V. CONSISTENCY WITH I&M’S 2015 IRP**

11 **Q. ARE THE ROCKPORT UNIT 2 DISPOSITION OPTIONS DESCRIBED IN**
 12 **TABLE 1 CONSISTENT WITH I&M’S RECENTLY-FILED IRP?**

13 **A.** Yes. As identified in TABLE 2 below, all three of the options identified on
 14 TABLE 1 are essentially the same as several of the “case” views found in the
 15 2015 IRP:

TABLE 2			
Rockport U2 CPCN Filing <u>'Option'</u>	<i>corresponds directly with...</i>	I&M 2015 IRP Submittal <u>'Case'</u>	<u>Description</u>
Option #1A	↔	"Steady State"	<i>BOTH assume RU2 is fully-retrofitted (SCR & DFGD) and operated thru useful life</i>
Option #1B	↔	"Fleet Modification"	<i>BOTH assume RU2 is retrofitted w/ SCR (only) then returned to Lessor @ 12/2022</i>
Option #2	↔	"Fleet Modification w/ No RU2 SCR"	<i>BOTH assume RU2 is NOT retrofitted w/ SCR then returned to Lessor @ 12/2019</i>

1 Q. ARE THE COMPARATIVE RESULTS TO BE DISCUSSED IN THIS DIRECT
2 TESTIMONY CONSISTENT WITH THE RESULTS SET FORTH IN I&M'S
3 2015 IRP?

4 A. Yes. As I will describe in further detail later, the relative results are very
5 consistent with the "case-to-case" results offered in the IRP. While they do
6 not much exactly match, those differences are minor and are explainable.

7 **VI. CAPACITY NEED**

8 Q. DOES I&M HAVE A CAPACITY NEED THAT WOULD BE INFLUENCED
9 BY THIS ROCKPORT UNIT 2 DISPOSITION DECISION?

10 A. Yes. First, as explained in greater detail in Attachment SCW-1, I&M has an
11 obligation to maintain a *minimum* PJM Installed Reserve Margin ("IRM") of
12 16.5 percent.⁴ This IRM represents an obligation under PJM's capacity
13 market construct—known as the Reliability Pricing Model ("RPM")—to ensure
14 adequate future capacity resources are available to cover the Company's
15 projected summer peak demand, as well as a reserve margin, needed to
16 reasonably ensure reliability in the event of unforeseen supply interruptions
17 and/or high peak demand events. As summarized on Attachment SCW-1,
18 Table 1-4, *inclusive* of Rockport Unit 2, the projected I&M IRM for the next
19 PJM RPM planning year, 2019/20,⁵ is estimated at 20.56 percent. This IRM

⁴ Beginning with the current 2019/20 (June 1 through May 31) PJM RPM planning year; and assumed to remain constant in all future RPM planning years. In prior (2016/7 through 2018/19) planning/delivery years this requirement was slightly lower at 16.4 percent.

⁵ As also discussed in Attachment SCW-1, I&M (as well as affiliates Appalachian Power Company and Kentucky Power Company) have continued to opt-out of the RPM "capacity auction" process by participating in the Fixed Resource Requirement ("FRR") "self-planning" construct afforded under the RPM. Under the RPM framework that establishes a 3-year forward commitment, this FRR obligation has now been established through at least the 2019/20 RPM planning year.

1 level would result in a capacity “length”—i.e., capacity levels above the
2 minimum 16.5 percent PJM criterion—of a reasonable 159 MW.

3 Therefore, any unit disposition decision that would implement an
4 alternative of retiring I&M’s 1,105 MW ownership and purchase entitlement
5 share of Rockport Unit 2 ⁶ would result in an immediate and significant need
6 to replace nearly all of that capacity to ensure the achievement of this PJM
7 IRM criterion. This explains why the “Option #1B” and “Option #2”
8 alternatives previously identified in TABLE 1 would necessitate a near-
9 concurrent replacement of the unit with significant capacity replacements.

10 **Q. IS THE UNDERLYING I&M LOAD AND PEAK DEMAND FORECAST AND**
11 **ULTIMATE CAPACITY “NEED” CONSIDERED AS PART OF THIS**
12 **ROCKPORT UNIT 2 DISPOSITION ANALYSIS ALSO CONSISTENT WITH**
13 **THAT WHICH WAS REPRESENTED IN THE COMPANY’S NOVEMBER,**
14 **2015 IRP?**

15 A. Yes. There were no changes to the long-term load and peak demand
16 forecast, as well as assumptions around available capacity resources, from
17 the forecast utilized in I&M’s 2015 IRP. I am aware that I&M was recently
18 notified that some contracts for wholesale supply may end in 2020. While the
19 load associated with these contracts was included in the long-term load
20 forecast, a potential change in the disposition of the load contracts, should
21 they leave the system, would not alter the conclusion in this testimony. The
22 potential loss of this approximately 300 MW of internal load would not
23 diminish the Company’s future need for Rockport Unit 2 or, alternatively,

⁶ 650 MW (50%) I&M ownership share of the 1300-MW unit; plus I&M’s 455 MW (70%) purchase entitlement from affiliate AEG’s 50% ownership share of the unit.

1 some level of replacement resources that reasonably approaches that unit's
2 level of capacity should it be returned to the Lessor.

VII. ECONOMIC MODELING PROCESS

3 **Q. HOW WERE THE ROCKPORT UNIT 2 DISPOSITION ALTERNATIVES**
4 **ANALYZED?**

5 A. The Company utilized a proprietary long-term resource optimization tool
6 known as Plexos® (also referred to as "Plexos® LT Plan") to perform this
7 evaluation. The economic evaluations were performed from the perspective
8 of a "stand-alone" I&M. This means there were no assumed capacity and
9 energy costs or credits flowing to/from affiliate AEP operating companies by
10 virtue of the fact that the long-standing AEP Interconnection Agreement
11 ("AEP Pool") has now been terminated and replaced with the FERC-
12 authorized Power Coordination Agreement ("PCA") effective January 1, 2014.
13 Under the terms of the PCA, I&M, as well as the other AEP-affiliate operating
14 company participants in the PCA, "...will be individually responsible for its
15 own capacity planning."⁷

16 Further, these resource optimization evaluations were performed over
17 an extended (30-year) modeled period (2016 through 2045) in the Plexos®
18 tool so as to roughly emulate the potential economic life-cycle of the
19 respective asset alternatives offered in TABLE 1; as well as in recognition of
20 the various future impacts on I&M's overall resource planning needs. As will
21 be described in more detail, the alternative-specific 'Net Utility Costs' were

⁷ Article 7.1 of the Power Coordination Agreement (FERC Docket No. ER13-235-000, approved on December 23, 2013).

1 then discounted to current, “(January) 2016” dollars and, as such, reflected on
2 a cumulative present worth (“CPW”) basis.

3 It is also critical to understand that the framework for these evaluations
4 was focused not on the *absolute* CPW results for I&M, but rather the
5 *comparative* view of the alternative options’ results. In other words, the
6 objective of this exercise was to identify the relative least-cost alternative
7 among the three primary options identified in TABLE 1. With that, the results
8 from Plexos® offer a view of these relative optimization economics over that
9 full, 30-year planning horizon and thereby do not in any way constitute an
10 isolated, single “test-year” cost-of-service view.

11 **Q. PLEASE DESCRIBE THE PLEXOS® LONG-TERM MODELING**
12 **APPLICATION.**

13 A. Plexos® is a proprietary software tool under license to AEPSC from Energy
14 Exemplar LLC, a power and gas industry software and data-services provider.
15 As indicated, the Plexos® LT Plan version of the application is a long-term
16 resource optimization model that offers multiple objective functions, including
17 determination of alternative planning solutions that offer the lowest utility cost.
18 In this case, it is intended to determine a proxy for the lowest “G(eneration)”
19 (net) cost-of-service.⁸ The model uses linear programming (“LP”) optimization
20 techniques to find the optimal portfolio of future capacity and energy
21 resources, including demand-side additions, that serve to minimize the CPW
22 of a planning entity’s production-related fixed and variable costs over a long-

⁸ It is important to re-emphasize that Plexos® does not produce, nor are these (relative) long-term modeling results intended to represent, a traditional “cost-of-service” view; recognizing that the latter process focuses on a single ‘absolute’—versus ‘comparative’—view of costs and is also limited to a single ‘test-year’—as opposed to a 30-year proforma—view.

1 term planning horizon. The model performs this optimization while also
2 recognizing user-input constraints such as requisite PJM reserve margin
3 requirements, as well as I&M fleet-wide or unit-specific stack emission (e.g.
4 SO₂ and NO_x) limitations.

5 This latter ability is important given that the Modified Consent Decree
6 also places a Rockport (total) station-specific “cap” on SO₂ emissions of
7 28,000 tons per year in 2016-2017; 26,000 tons per year in 2018-2019;
8 22,000 tons per year in 2020-2025; 18,000 tons per year in 2026-2028; and
9 10,000 tons per year in 2029 and thereafter.⁹ These station-specific SO₂
10 requirements are over-and-above the pre-existing AEP performance
11 thresholds around SO₂ and NO_x emissions as set forth in the original NSR
12 Consent Decree. As further described by Company witness Hendricks, the
13 retrofit of SCR on Rockport Unit 2 will contribute to the attainment of that
14 Consent Decree requirement.

15 **Q. HAS THE PLEXOS® APPLICATION BEEN UTILIZED BY THE COMPANY**
16 **IN MATTERS BEFORE THIS COMMISSION?**

17 A. Yes. Plexos® was utilized as the applicable modeling tool for determining the
18 relative economics of the Rockport Unit 1 SCR Project in Cause No. 44523. It
19 was also utilized as the basis for all proforma analyses in I&M’s most recent
20 IRP submitted on November 2, 2015. Specifically, it served as the basis for
21 the establishment of the resource planning included under Section 8-

⁹ The last threshold year (2029) representing the first year in which both Rockport units would be potentially retrofitted with DFGD technology under the Modified Consent Decree.

1 “Selection of the Resource Plan”—as required under 170 IAC 4-7-8.¹⁰
2 Additionally, Plexos® was utilized as part of the Company’s most recent
3 biannual Fuel Adjustment Clause (“FAC”) filings.¹¹ It was also utilized as part
4 of I&M’s most recent Environmental Compliance Cost Rider (“ECCR”)
5 filings.¹² Likewise, Plexos® was utilized to establish I&M’s most recent Power
6 Supply Cost Recovery plan for its Michigan retail jurisdiction.¹³ Further,
7 Plexos® has recently been utilized by other AEP operating companies to
8 support both long-term resource planning options as well as shorter-term fuel
9 factor applications before Commissions in the states of Arkansas, Kentucky,
10 Oklahoma, Texas, Virginia, and West Virginia.

11 **Q. YOUR TESTIMONY DESCRIBES THAT THE PLEXOS® (LT PLAN)**
12 **MODELING CREATES A PROXY FOR LONG-TERM NET UTILITY**
13 **“G(ENERATION)” COSTS. WHAT ARE THE FUNDAMENTAL MODELING**
14 **PROCESSES AND OUTPUTS THAT CREATE THESE RESULTS?**

15 A. First, the Plexos® model seeks to emulate the PJM energy construct in which
16 all available generation is offered into, and is compensated by, the PJM
17 energy market; while all Load Serving Entities, such as I&M, are price-takers
18 from that market. Both of these time-based value-sets are predicated on the
19 future, fundamentals-based price of energy which will be described later in
20 this testimony. As a vertically-integrated utility, the subsequent ‘netting’ of
21 those (PJM) “(Generation) Market Revenues” and “Load Costs” profiles are

¹⁰ See Section 5 of that submittal for a description of how Plexos® LT Plan was utilized in I&M’s 2015 IRP.

¹¹ See IURC Cause Nos. 38702-FAC73, 38702-FAC74 and 38702-FAC75 and 38702-FAC76.

¹² See IURC Cause Nos. 43992-ECCR 4 and 43992-ECCR 5.

¹³ See MPSC Case No. U-17919

1 then appended to the anticipated production cost of I&M's native generation,
 2 to create a full picture of I&M's projected future net utility (generation) costs.
 3 The model determines such generation-related costs as follows:

4 *Cost of Generation...*

5 Variable Costs associated with I&M generating units' ability to offer—and
 6 ultimately dispatch—into the (PJM) energy market. Such attendant variable
 7 costs including:

- 8 • Fuel;
- 9 • Start-up oil;
- 10 • Consumables such as sodium bicarbonate, activated carbon,
 11 anhydrous ammonia, and lime;
- 12 • Variable O&M; and
- 13 • Market replacement cost of emission allowances and/or carbon 'tax'

14 *Plus:* Variable Costs of Energy Purchases

15 *Plus:* Fixed Costs of Capital Additions *; *i.e.*, Investment Carrying Charges (based
 16 on I&M's weighted cost of capital)

17 *Plus:* Fixed O&M of Capacity Additions

18 *Plus:* Fixed Cost of Capacity Purchases

19 *Plus:* Program Costs of (Incremental) Demand-Side Management (DSM) options

20 = **Total Generation Costs**

21 * Note: Any on-going 'return-on' and 'return-of' (depreciation/amortization) capital costs
 22 associated with pre-existing generation plant-in-service and other balance sheet
 23 assets/obligations are ignored, as such attendant costs would be assumed to be
 24 consistent across all unit disposition options evaluated.

25 To further summarize, the Plexos® model simultaneously determines
 26 the energy-related "Cost of Load" based on projected PJM "scaled" (e.g.
 27 hourly on-peak and off-peak) market energy prices applied to I&M's
 28 forecasted native load obligation—and underlying load shape. The model
 29 output then performs a concurrent "netting" of: a) I&M's Load cost; and b) the
 30 production *revenue* made into the forecasted (PJM) energy market from the
 31 *generation* shape profiles modeled for each I&M generation resource. When
 32 then further coupled with the "Cost of Generation" previously defined, the

1 ultimate 'net' output represents a proxy for I&M's net load/production-related
 2 generation costs. The final component output from the modeling process
 3 would be the monetization of any I&M capacity length (long or short
 4 position)—vis-a-vis PJM's minimum reserve margin requirements—based on
 5 projected PJM capacity market values. The *final* result is the establishment of
 6 I&M's "Net Utility (Generation) Costs" summarized as follows:

7 (PJM) Load Cost
 8 *Plus:* Cost of Generation (*as above*)
 9 *Less:* (PJM) Energy Market Revenue
 10 = Net Load/Production-related Generation Costs
 11 *Less:* (PJM) Capacity Market Revenue/<Cost>
 12 = **Net Utility (Generation) Costs**

13 These life cycle costs through the 2045 modeled optimization period,
 14 along with applicable end-effects¹⁴, are then "present-valued" using a proxy of
 15 the estimated I&M-weighted average cost of capital, to create a CPW of Net
 16 Utility (Generation) Costs.

17 **Q. SPECIFICALLY, HOW DID THE PLEXOS® MODEL PERFORM THE**
 18 **ROCKPORT UNIT 2 DISPOSITION ANALYSES SUMMARIZED ON TABLE**
 19 **1?**

20 A. For "Option #1A", the model incorporated the Rockport Unit 2 SCR Project
 21 alternative—and timing thereof—as described earlier in TABLE 1.
 22 Specifically, Rockport Unit 2 was assumed to be "fully-retrofitted" in the future,
 23 first with DSI and associated equipment (for MATS compliance), then SCR

¹⁴ Recognizing the varying life cycle periods among alternatives evaluated, an "end-effects" determination was made that is representative of the present value of any on-going cost streams beyond the model's 2045 optimization period.

1 technology by December 31, 2019; and finally with subsequent anticipated
2 environmental-related retrofits thereafter—including DFGD technology—by
3 December 31, 2028. The Rockport Lease was assumed to be renewed for
4 Unit 2, while the remaining I&M generating units were assumed to follow the
5 “base” disposition path assumptions as previously discussed.

6 For “Option #1B”, the model assumed Rockport Unit 2 would be
7 returned to the unit’s Lessors at the lease termination date of December,
8 2022, with the installation of the SCR in 2019—consistent with Option #1A—
9 but, naturally then, *without* the installation of a DFGD in 2028. Upon the unit’s
10 assumed return to the Lessors, the model further assumed that nearly all of
11 the significant displaced Rockport Unit 2 capacity and energy would require
12 concurrent replacement resources.

13 Finally, for “Option” #2, the model assumed Rockport Unit 2 would be
14 returned early to the Lessors—by December 2019—*without* the installation of
15 an SCR in 2019, and a DFGD in 2028. This modeled view also incorporated
16 the required concurrent resource replacement upon the unit’s return to the
17 Lessors.

18 For each view (Options #1B and #2) requiring nearer-term replacement
19 resources, the model was given the ability to select the specific type of
20 capacity resource required to replace Rockport Unit 2 by way of Plexos®-LT
21 Plan’s resource optimization logic. In that regard, given the assumption of the
22 impracticality of a coal solution due to proposed CO₂ emissions regulations
23 applicable to new fossil-fired generating resources, a new coal-fired

generating build was not considered.¹⁵ Likewise, given the financial impracticability of new nuclear capacity with estimates costs exceeding \$6,000/kW, a new nuclear unit was also not considered.¹⁶ With that, the model had the ability to choose between some combination of natural-gas fired combined cycle (“CC”), combustion turbine (“CT”), aeroderivative (“AD”), combined heat and power (“CHP”), as well as renewable and incremental demand-side management (“DSM”) resources; all consistent with the resource replacement options utilized in the 2015 IRP.¹⁷

From there, the model was set up with the necessary input parameters, such as capital cost to retrofit or to replace with alternative resources, the attendant fuel cost and generator performance parameter data, modifications to variable and fixed O&M, etc. Based on these inputs, beginning in the year 2020—the initial full year of Rockport Unit 2 being retrofitted with SCR—the model was then capable of recognizing any relative change in the overall I&M generation profile for each of the three Rockport Unit 2 disposition options identified in TABLE 1. Additionally, the capacity resource planning aspect of the tool recognized the megawatt contribution of these alternative solutions when determining capacity needs for I&M *beyond*

¹⁵ New EPA regulations pertaining to Section “111(b)” of the Clean Air Act require new coal-fired generating facilities to emit no more than 1,400 lb/Mwh of CO₂; levels essentially unachievable without some form of costly carbon capture and sequestration technology.

¹⁶ For example, a nuclear unit @ 1,100 MW –roughly comparable to the size of either of I&M’s D.C. Cook nuclear units; or the size of I&M’s share of Rockport 2 being replaced— would cost \$6.6 Billion (\$6,000/kW x 1,100 MW x 1,000 kW/MW = \$6,600,000,000).

¹⁷ Specifically, additional DSM over-and-above the levels embedded in the Company’s load & peak demand forecast (as summarized on Attachment SCW-1, Table 1-3); as well as additional I&M renewable resources over-and-above those currently identified (or footnoted) on Attachment SCW-1, Table 1-2.

1 2020, as it modeled throughout the long-term optimization planning horizon
2 (*i.e.*, through 2045).

3 **Q. PLEASE IDENTIFY SOME OF THE INPUT PARAMETERS FOR THESE**
4 **ROCKPORT UNIT 2 DISPOSITION ANALYSES?**

5 A. Two of the major underpinnings in this process are long-term forecasts of
6 I&M's energy requirements and peak demand, as well as the price of various
7 generation-related commodities, including energy, capacity, coal, natural gas,
8 and CO₂/carbon. Both forecasts were created internally within AEPSC. The
9 load forecast, including I&M load and peak demand summaries discussed in
10 Attachment SCW-1, represents the projection created by the AEP Economic
11 Forecasting organization in June 2015 that led up to, and was utilized in, the
12 2015 IRP. Attachment SCW-2 offers the long-term commodity pricing
13 forecast established by the AEP Fundamental Analysis group in that same
14 June/July 2015 timeframe. These respective organizations have had years of
15 experience forecasting I&M and AEP system-wide demand/energy
16 requirements and fundamental pricing for both internal operational and
17 regulatory purposes.

18 Other critical input parameters include the installed cost of the required
19 Rockport Unit 2 SCR Project, the cost to build/buy replacement capacity (e.g.
20 CC, CTs, ADs, CHP, renewable [wind, solar], or incremental DSM), as well as
21 the attendant on-going operating costs and performance parameters
22 associated with those unique options, where applicable. Much of this
23 information is summarized on Attachment SCW-3. The critical build-cost data

1 was largely provided by Company witness Pifer and the AEP Generation
2 organization of which he is a part.

3 **Q. PLEASE PROVIDE AN ADDITIONAL OVERVIEW OF THE “RETURN AND**
4 **REPLACE” OPTIONS (OPTION #1B AND OPTION #2).**

5 A. The Plexos® modeling required to reasonably proxy this option as it pertains
6 to the installation of nearer-term baseload/intermediate duty-cycle capability
7 was based on resource “blocks” equivalent to *one-half* of a Mitsubishi 501
8 GAC 2x2x1 combustion turbine/heat recovery steam generator
9 (HRSG)/steam turbine design¹⁸ natural gas CC that would have a nominal
10 capability of approximately 780 MWn¹⁹. This was done as an input process to
11 the Plexos® modeling so as to allow for reasonably equivalent “block-sizes”
12 amongst the available resource options. Therefore, each CC equivalent
13 block-size the model could select was equal to 390 MWn. This type/construct
14 of CC was screened as being the ‘best-in-class’ from multiple potential CC
15 designs.

16 The chosen proxies for potential peaking duty-cycle capability were
17 based on both a simple-cycle General Electric (“GE”) 2x ‘7FA’ (large-frame)
18 and GE 2x ‘7EA.03’ (small frame) natural gas CT block-sizes the model could
19 select having a nominal capability of approximately 431 and 189 MWn,
20 respectively.²⁰ Additionally, the model could choose 2x GE LM6000 AD units

¹⁸ This represents two natural gas combustion turbines in combination with two HRSGs and a single steam turbine.

¹⁹ This Mitsubishi design CC would provide, via evaporator cooling, additional unit generating capability—albeit at some thermal efficiency/heat rate penalty—to 870 MW.

²⁰ Each GE 7FA turbine is nominally rated @ 215.5 megawatts (“MWn”). Each GE 7EA.03 turbine is nominally rated @ 89.5 MWn. A minimum GE 7FA and 7EA.03 SC block size was assumed to be 2 turbines; or ~431 MWn and 189 MWn, respectively.

1 having a nominal capability of approximately 87 MWn²¹ per block. Lastly, it
2 could also select scaled CHP-cogeneration units²². The GE SC-CTs, GE-
3 ADs as well as CHP generating resources were all screened as the best-in-
4 class from multiple potential “peaking” duty-cycle resource options.

5 **Q. WHAT ESTIMATED COSTS FOR OPTION #1A, OPTION #1B, AND**
6 **OPTION #2 WERE UTILIZED IN THE ECONOMIC EVALUATIONS?**

 A. The following **TABLE 3** offers a summary of the installed cost estimates modeled:

²¹ Each GE LM6000 AD turbine is nominally rated @ approximately 43.5 MWn, also with a minimum block size of 2 turbines; or ~87MWn.

²² The CHP-cogeneration tranche size is based on a reduced-scaled LM6000 turbine, coupled with a full steam host, offering a generation output of approximately 15 MWn.

TABLE 3

(A) Rockport U1 & U2 capacity rating post-planned LP Turbine (36 MW each) uprates (2017 & 2019)

(B) Rockport U1 & U2 capacity rating post-DFGD retrofits (<18 MW> each) derates (2025 & 2028)

(C) I&M would ALSO incur its 70% share of fixed costs associated with AEG's like-50% share of the project (or, 35% of the 'Total Project') under the terms of the affiliate AEP Generating Company (AEG) Unit Power Agreement with I&M.

(D) AEP Projects cost estimates used for modeling purposes.

(E) Assumes a full-utilization steam host (thermal efficiency @ ~4,858 Heat Rate)

1 The costs reflect the 50 percent (\$137 million) I&M ownership share of
2 the capital expenditure associated with the Option #1A and #1B Rockport Unit
3 2 SCR Project. I&M-affiliate AEG would be responsible for the other 50
4 percent share of the required capital expenditure. In recognition of this,
5 however, these I&M-Rockport Unit 2 disposition analyses *also* considered 70
6 percent of the costs of the AEG ownership portion of this retrofit solution by
7 virtue of I&M's obligation under the AEG UPA. Stated another way, the
8 Option #1A and #1B analyses effectively reflected 85 percent (1,105 MW) of
9 the capacity (and energy output), as well as the respective attendant costs,
10 associated with the approximate 1,300 MW Rockport Unit 2 SCR Project
11 estimate.²³

12 Note also that these costs are exclusive of allowance for funds used
13 during construction ("AFUDC"). As it pertains to the Option #1A and #1B
14 Rockport Unit 2 SCR Project estimate, the total project cost inclusive of
15 production capital overheads as well as AFUDC was modeled at
16 approximately \$295 million (with I&M's 50% ownership share being
17 approximately \$147 million). Conservatively, this calculated AFUDC proxy of
18 nearly \$21 million (I&M's ownership share being approximately \$10 million)
19 was incorporated for comparative modeling purposes only and is, obviously,
20 before consideration of any potential construction work in progress ("CWIP")
21 recovery treatment as discussed in Company witness Williamson's testimony

²³ Represents I&M's 50% ownership share, plus, 70% of AEG's 50% ownership share, or 85%.

1 that would serve to eliminate all or a portion of any such project-related
2 AFUDC.²⁴

3 **Q. EARLIER YOU DISCUSSED “DOWN-STREAM” COSTS ASSOCIATED**
4 **WITH ENVIRONMENTAL INVESTMENTS BEYOND THE CURRENT**
5 **ROCKPORT UNIT 2 SCR PROJECT. PLEASE BRIEFLY DESCRIBE THE**
6 **OPTION #1A TOTAL UNIT 2 COST PROJECTIONS INCORPORATED**
7 **INTO YOUR MODELING.**

8 A. As summarized on TABLE 3, the Plexos® modeling for Option #1A
9 incorporated approximately \$1,347 million of additional estimated I&M capital
10 costs for various future Rockport Unit 2 projects beyond this Unit 2 SCR
11 Project. Specifically, this figure represents I&M’s 85 percent ownership *and*
12 (AEG) purchased power share of the combined investment in future Unit 2
13 DFGD and associated equipment (total \$1,394 million), and “CCR/ELG-
14 related” (\$191 million, total plant) capital costs identified on TABLE 3.²⁵

15 **Q. HOW WERE ROCKPORT UNIT 2 CAPACITY REPLACEMENT**
16 **ALTERNATIVES CONSIDERED IN EITHER OPTION #1B OR OPTION #2?**

17 A. The Plexos® modeling was based on the assumption that any and all
18 incremental capacity and energy requirements to achieve I&M’s projected
19 native peak demand and load requirements, in recognition of a Rockport Unit
20 2 return to Lessors by December 2022 (Option #1B), or by December 31,
21 2019 (Option #2), would be wholly met via CC, CT, AD, CHP, renewable and

²⁴ \$295 million total (100%) project cost - \$274 million total cost (including production capital overhead, but excluding AFUDC – see TABLE 3)

²⁵ (\$1,394 million + \$191 million) x 85% = \$1,347 million (including capital overheads, excluding AFUDC).

1 incremental DSM replacement capacity and energy contemporaneously with
2 those respective dates.

3 **Q. IN DEVELOPING THE COMPANY'S FUTURE RESOURCE**
4 **ALTERNATIVES AS PART OF OPTIONS #1B AND #2, DID THE**
5 **COMPANY EVALUATE DEMAND-SIDE/ENERGY EFFICIENCY AND**
6 **DEMAND RESPONSE RESOURCES?**

7 A. Yes. As described and detailed in Attachment SCW-1, Section H, DSM in the
8 form of Energy Efficiency (EE) and Demand Response (DR) initiatives have
9 been incorporated into the Company's resource planning process, initially, as
10 part of its underlying load forecast. These forecasted levels of EE reductions
11 incorporated into all of I&M's long-term resource modeling are significant.
12 Note on Table 1-3 of Attachment SCW-1, that the Company is projected to
13 realize permanent peak demand reductions from EE alone of 64 MW over the
14 balance of this decade. Additionally, the Company is expected to add further
15 peak demand reductions via 'demand response' activity of 298 MW. With
16 that, the Company's *total* demand-side peak reduction capability is already
17 projected to be 363 MW by 2020. This amount is equal to approximately 9.8
18 percent of I&M's forecasted retail peak demand.²⁶ Given the more limited
19 ability of DSM to add extremely large tranches of resources to I&M's overall
20 portfolio—over-and-above what is already contemplated in the underlying
21 load and peak demand forecast—as a practical matter such amounts must be
22 considered minimal in the context of the approximate 1,100 MW of I&M's
23 share of Rockport Unit 2 capacity that would be required to be replaced.

²⁶ Based on projected 2020 I&M (retail only) peak demand *before* DSM of 3,702 MW.

1 That said—consistent with the underlying modeling for its 2015 IRP--
2 I&M's Plexos® long-term resource optimization modeling did consider such
3 *incremental* contributions of EE resources as part of this Rockport Unit 2
4 evaluation process. The model was given the ability to select from eight (8)
5 potential incremental DSM-EE measure “bundles” including: Residential
6 Heating/Cooling; Residential Thermal Shell; Residential Lighting; Residential
7 Water Heating; Residential Appliances; Commercial Heating/Cooling;
8 Commercial Lighting; and Commercial Office Equipment.

9 **Q. COULD ADDITIONAL RENEWABLE RESOURCES—OVER-AND-ABOVE**
10 **I&M'S 450 MW OF WIND RESOURCES AND 15 MW OF SOLAR**
11 **RESOURCES—BE CONSIDERED A VIABLE DISPOSITION**
12 **ALTERNATIVE FOR ROCKPORT UNIT 2 REPLACEMENT CAPACITY IN**
13 **OPTIONS #1B AND #2?**

14 A. Yes, but as with incremental DSM, only to a limited degree. Given the
15 intermittent nature of, for instance, wind resources, only a small percentage of
16 the “nameplate” capacity rating of wind is currently being recognized by PJM
17 for reliability/capacity resource adequacy planning purposes. In fact, PJM
18 initially recognizes or “counts” only 13 percent of a wind resource’s nameplate
19 (MW) rating for such capacity planning purposes.

20 Further, as described more fully in Attachment SCW-1, beginning with
21 the 2020/21 PJM Planning Year a new FERC-authorized RPM tariff referred
22 to as the “Capacity Performance” construct will be in full effect. At that point
23 all intermittent resources, including wind, are anticipated to experience a
24 further reduction in the level of capacity resources that may be applied when

1 establishing PJM capacity position/need. For purposes of future capacity
 2 resource commitments under that Capacity Performance construct, the
 3 Company assumed that the amount of a wind resource's nameplate
 4 (capacity) rating that will be applicable would be zero beginning with that
 5 2020/21 PJM-RPM planning period. Therefore, wind resources, which can be
 6 a beneficial source of energy by adding diversity to a generating portfolio,
 7 cannot serve as a viable *capacity* replacement alternative in this instance. In
 8 any event, irrespective of the anticipated new 'Capacity Performance'
 9 limitations, even under the *current* (13 percent of nameplate) PJM
 10 framework—which is not subject to conjecture—wind resources would be
 11 able to contribute only limited capacity resources to meet the reserve margin
 12 criterion. For example, to meet even just one-tenth of the Company's
 13 capacity obligation in lieu of Rockport Unit 2 post-2020, 850 MW (nameplate)
 14 of additional wind resources would be required over-and-above the 450 MW
 15 of wind resources the Company already currently possesses.²⁷ Under the
 16 emerging *Capacity Performance* approach, wind has been assumed not to
 17 “count” for purposes of I&M achieving its future capacity resource
 18 requirement.

19 The implication is similar for solar resources. That is, currently PJM
 20 initially counts only 38 percent of a solar resources nameplate MW rating
 21 when establishing capacity contribution to meet load/demand and reserve
 22 margin obligations. Unlike wind resources, however, for purposes of future
 23 resource commitments under that Capacity Performance construct, the

²⁷ $1,105 \text{ MW} \times 1/10 = 110.5 \text{ MW} / 0.13 \text{ (PJM [nameplate] assumed installed capacity criterion limitation re wind resources)} = 850 \text{ MW}$

1 Company assumed that the amount of a solar resource's nameplate rating
 2 that will be applicable for capacity planning purposes would remain at that 38
 3 percent level beginning with that 2020/21 PJM-RPM planning period.²⁸ So,
 4 again, to meet even just *one-tenth* of the Company's capacity obligation in
 5 lieu of Rockport Unit 2, over 290 MW (nameplate) of additional solar
 6 resources would be required post-2020.²⁹

7 However, to be non-discriminatory as to the overall make-up of the
 8 available suite of resources to potentially replace Rockport Unit 2, the
 9 Company—as it did with incremental DSM—considered the prospect of
 10 renewable resources; namely, wind and large/community-scale solar, as
 11 potential capacity (and energy) resource options from which the Plexos®
 12 long-term optimization modeling could select over the long-term optimization
 13 study period. As with incremental DSM, however, this would recognize that,
 14 at best, such (incremental) wind or solar resources would likely be able to
 15 contribute only a small fraction of the *capacity* contribution lost by the
 16 retirement of Rockport Unit 2.

17 **Q. ARE THESE WIND AND SOLAR CAPACITY RESOURCE CRITERIA**
 18 **CONSISTENT WITH THOSE UTILIZED IN I&M'S 2015 IRP?**

19 A. Yes. The 2015 IRP also assumed the 'post-2020' level of wind and solar that
 20 could 'count' in the achievement of its PJM minimum reserve margin
 21 requirement would be set at 0 percent and 38 percent of nameplate,
 22 respectively.

²⁸ This was done in recognition of the fact the load shape of a solar resource is typically more coincident to an overall PJM summer peak condition/hour than that of a wind resource.

²⁹ $1,105 \text{ MW} \times 1/10 = 110.5 \text{ MW} / 0.38 \text{ (PJM [nameplate] installed capacity criterion limitation re solar resources)} = 291 \text{ MW}$

1 **Q. IS PROJECTED NATURAL GAS PRICING A DRIVER FOR SUCH**
2 **ANALYTICAL PROCESSES?**

3 A. Yes, it typically is. In the electric utility industry, the natural gas-fired units
4 often serve as the marginal cost, or “price-setting” units based on their
5 relative higher position in a typical regional dispatch stack (relative to lower
6 variable cost hydro, nuclear and coal-fired units). In PJM, that is most
7 typically the case during “on-peak” hours.³⁰ Therefore, the price of natural
8 gas will not only determine where gas-fueled units may fall in any regional
9 dispatch stack, it will then largely determine the Locational Marginal Price
10 (“LMP”) in which energy may clear in any market-based system such as PJM.

11 Typically, the higher the natural gas price, the higher gas-fired units—
12 such as even thermally-efficient combined cycle units—would climb in PJM’s
13 dispatch stack; and then, depending upon contemporaneous load
14 requirements and constraints, the higher the resulting market-based energy
15 price/LMP might be. Based on that, margins or “spreads” available to more
16 efficient coal-fired units could simultaneously be improved.

17 Conversely, the lower the gas price, the lower these CC units may fall
18 in PJM’s market-based dispatch/supply stack, thereby setting a lower clearing
19 price for a greater number of hours/sub-hours. Under this latter outcome,
20 coal units could potentially be called upon to generate less energy at a lower
21 available spread.

22 **Q. PLEASE PROVIDE AN OVERVIEW OF THE FORECASTED**
23 **FUNDAMENTAL COMMODITY PRICING, INCLUDING NATURAL GAS,**

³⁰ Although the definition varies, typically, on-peak hours represent a 16-hour per-day period M-F, 6AM-10PM, excluding holidays.

1 **THAT WERE USED IN THE ROCKPORT UNIT 2 DISPOSITION**
 2 **ANALYSES?**

3 A. As shown in **TABLE 4** below, an array of five (5) unique, long-term
 4 commodity pricing scenarios were utilized in the Rockport Unit 2 disposition
 5 analyses, consisting of a “base” view; two “price banding” sensitivity views;
 6 and two “CO₂/carbon” views:

TABLE 4

‘BASE’ Forecast ... reflecting:

- Recognition of relatively lower fuel price trending due to proliferation of shale gas, increasing natural gas price elasticity; as well as capturing a likely implementation profile of environmental regulation including CSAPR, MATS Rule and potential CO₂ mitigation via a ~\$15/tonne³¹ “carbon tax” (beginning in 2022).

Commodity Price Banding Scenarios...

2. “Higher Band” ... same as the BASE case except:

- Bounds the high-end of the BASE case with plausible fuels, emissions and energy pricing—with appropriate feedback for load response—and with such fuel prices varying by approximately a +1.0 standard deviation.

3. “Lower Band” ... same as the BASE case except:

- Likewise, bounds the low-end of the BASE case with plausible fuel, emissions and energy pricing, with such fuels prices varying by approximately a -1.0 standard deviation.

CO₂ Pricing Scenarios...

4. “No Carbon” Price... same as the BASE case except:

- Removes the proxy carbon tax from the suite of commodity pricing; while then adjusting for the correlative effects on other commodities associated with that removal.

5. “High Carbon” Price... same as the BASE case except:

- Increases the scale of the relative carbon tax by a magnitude of approximately 60% (to ~\$25 tonne).

³¹ The unit of measure representing a “metric” ton of CO₂ equal to 1,000 kilograms or 2,204 pounds and represented in “real” (2014) dollars.

1 The “BASE” Forecast” view reflects the full suite of long-term projection
2 of commodity prices—inclusive of natural gas prices—established by the AEP
3 Fundamental Analysis group that were used in this analysis. This forecast
4 was internally published in the mid-2015 timeframe. Selected commodity
5 pricing projections from that suite are reflected in Attachment SCW-2. This
6 BASE Forecast view focused significantly on emerging natural gas pricing
7 dynamics and considered evolving information that would support natural gas
8 supply increases tied to the projected emergence of additional, significant
9 levels of domestic shale gas at very competitive extraction costs.

10 This long-term view also assumes and embeds a “CO₂ pricing” impact
11 as a result of potential carbon regulation such as the regulation of CO₂
12 emissions from *existing* fossil-fueled generating sources as recently set forth
13 by the U.S EPA under Section 111(d) of the Clean Air Act via its Clean Power
14 Plan (“CPP”). In conjunction with the final CPP ultimately submitted in August
15 of 2015, the timing of a carbon pricing proxy in these long-term fundamental
16 pricing forecasts was likewise assumed to be the year 2022.³²

17 **Q. ARE THE LONG-TERM COMMODITY PRICE FORECASTS USED IN THIS**
18 **ROCKPORT UNIT 2 SCR PROJECT ANALYSIS—SUMMARIZED ON**
19 **TABLE 4—CONSISTENT WITH THE PRICING FORECASTS USED IN**
20 **I&M’S RECENT (NOVEMBER 2015) IRP SUBMITTAL?**

³² The Company and AEP’s assumption/position around the prospect of a CO₂ carbon tax has been consistently assuming such a value/price in the AEP Fundamental Analysis group’s “base” pricing projections since approximately the ‘2008’ vintage forecasts; through the 2015 vintage forecast. The initial *timing* of such CO₂/carbon pricing in those earlier forecasts started around the year 2015, and has gradually migrated to the currently-assumed 2022 effective date.

- 1 A. Yes, the forecasted pricing used in I&M's 2015 IRP is the same for all
2 scenarios represented on TABLE 4.

3 **VIII. EVALUATION OF MODELING RESULTS**

4 **Q. BASED ON THESE INPUT PARAMETERS, WHAT WERE THE RESULTS**
5 **OF THE ROCKPORT UNIT DISPOSITION ANALYSES PERFORMED IN**
6 **PLEXOS®?**

- 7 A. Attachment SCW-4-1 and Attachment SCW-4-2 offer tabular summarizations
8 and comparison of the modeling results for the three primary disposition
9 options for Rockport Unit 2 that were outlined in TABLE 1. Attachments
10 SCW-4A through 4E offer a broader view of the results for the BASE (pricing)
11 Forecast and each of the four alternative commodity pricing scenarios defined
12 in TABLE 4 above.

13 Again, these modeling results represent relative cost analyses,
14 meaning each are compared to one another in the determination of the "least-
15 cost" alternative outcome. Given that, Attachment SCW-4-1 and Attachment
16 SCW-4-2 reflect the relative costs of the alternative options that would call for
17 the 'return and replacement' of Rockport Unit 2 (Options #1B and #2) when
18 *compared to* a reference alternative. For purpose of these economic
19 assessments, the reference alternatives were established as being each of
20 the "Install SCR" alternatives—Option #1A and Option #1B.

21 Attachment SCW-4-1 offers a comparison versus *Option #1A* as the
22 reference view. Here the analysis is assessing the relative economics of not
23 only the Rockport Unit 2 SCR Project, but also the eventual prospect of

1 further retrofits on Rockport Unit 2; all versus options that would return the
2 unit to the Lessors in the relative near-term and replacing with alternative
3 resources.

4 Attachment SCW-4-2 offers a different perspective by offering a similar
5 relative comparison, but with *Option #1B* as the reference view. This
6 comparison rather focuses on the relative economics of the Rockport Unit 2
7 SCR Project nearly *exclusively*—specifically, for Option #2 vs. Option #1B.
8 The reason for this is that subsequent to the year 2022, there are essentially
9 little-to-no cost differences between those two alternatives as both are setting
10 forth largely the same Rockport Unit 2 “replacement” resource profile.

11 **Q. PLEASE SUMMARIZE THE RESULTS IN ATTACHMENTS SCW-4-1 AND**
12 **SCW-4-2.**

13 A. Attachment SCW-4-1:

14 This attachment offers an all-encompassing view of the relative
15 modeling results for the evaluations performed in Plexos®. It is segregated
16 into the five sets of future commodity pricing scenarios—displayed vertically—
17 that were identified in TABLE 4, all vis-à-vis Option #1A. Supporting
18 information for each of those option-specific pricing scenario views is offered
19 individually as part of supporting Attachments SCW-4A through 4E.

20 Focusing first on the relative disposition results under the “BASE
21 Forecast” commodity pricing scenario, it suggests that the Rockport
22 alternative “SCR Retrofit Rockport 2 by 12/2019; then Return and Replace
23 with various resource alternatives (CC, CTs, AD, CHP, renewables, and
24 incremental DSM) by 1/2023” (Option #1B) would be more costly than Option

1 #1A by \$84 million over the long-term study period. Moving down the
2 attachment to assess the “sensitivity” pricing scenarios, Option #1B is more
3 costly by amounts ranging from \$349 million for the “Higher Band” price
4 scenario; to being \$131 million *less* costly under the “Lower Band” price
5 scenario.

6 Focusing next on the other Rockport Unit 2 disposition alternative
7 modeled, the “No SCR Retrofit, but Return and Replace with various resource
8 alternatives by 1/2020 (Option #2) would be more costly than Option #1A by
9 \$322 million under the “BASE” pricing scenario. It also indicates that Option
10 #2 is more costly by amounts ranging from \$621 million to \$99 million; again
11 under the same respective long-term “Higher Band” and “Lower Band” pricing
12 scenarios.

13 Attachment SCW-4-2:

14 Now considering these results from the perspective of Option #1B,
15 under BASE commodity pricing scenario, it indicates that Option #2 would be
16 more costly than Option #1B by \$239 million over the long-term study period.
17 Moving down the attachment to assess the “sensitivity” pricing scenarios,
18 Option #2 is more costly by amounts ranging from \$272 million for the “Higher
19 Band” price scenario, to \$230 million for the “Lower Band” pricing scenario.

20 **Q. WHAT ADDITIONAL OBSERVATIONS AND CONCLUSIONS CAN YOU**
21 **DRAW FROM THE ECONOMIC COMPARISONS OFFERED IN**
22 **ATTACHMENTS SCW-4-1 AND SCW-4-2?**

23 A. In general, the Plexos® results summarized in Attachment SCW-4-1 and
24 Attachment SCW-4-2 indicate that, as compared to Option #2, the Rockport

1 Unit 2 SCR Project—reflected in both Option #1A *and* Option #1B—is
2 economically-favored across the full range of long-term pricing scenarios
3 modeled. Therefore, assessing these modeled CPW differences between
4 “Option #1A / Option #1B” and Option #2 that are reflective of these
5 significantly discrete long-term fundamental commodity pricing elements—
6 i.e., inclusive of an approximate -1.0/+1.0 standard deviation around volatile
7 natural gas pricing³³—it would indicate that a nearer-term solution that would
8 call for the retrofitting of Rockport Unit 2 with SCR technology by December
9 31, 2019, would be the most economical option for I&M and its customers.

10 Further, Option #1A represents a unit disposition alternative that is
11 intended to offer a potential longer-term perspective around the economic
12 viability of Rockport Unit 2. As previously indicated in this testimony,
13 however, any decisions around the subsequent required environmental
14 retrofits for that unit—chiefly, a DFGD installation by December 2028—would
15 be considered as part of a future CPCN application before this Commission.
16 What the relative “Option #1A versus Option #1B” economics *would* indicate
17 is that it is currently “too close to call” in terms what that future disposition of
18 the unit might be *beyond* what has clearly been demonstrated for Option #1B
19 (i.e., through the unit’s potential Lease termination date of December 2022).
20 Therefore, the results suggest that the proposed Rockport Unit 2 SCR Project
21 solution may also be viewed as preserving an option for I&M and its
22 customers to consider the prospect of continuing to operate Rockport Unit 2

³³ See TABLE 4 pricing scenario descriptions.

1 over the long-term (Option #1A) by ultimately retrofitting it with DFGD
2 technology as required under the Modified Consent Decree.

IX. "CARBON" RISK ASSESSMENT

3 **Q. DID I&M CONSIDER THE PROSPECTS FOR POTENTIAL FUTURE**
4 **CARBON REGULATION IN THIS ECONOMIC ANALYSIS?**

5 A. Yes. As discussed in TABLE 4 and immediately thereafter, the Company
6 considered—as a cost/valuation “proxy” for modeling purposes—a presumed
7 “carbon tax” effective in the year 2022. As identified on Attachment SCW-2,
8 the level of this carbon tax that was incorporated into the long-term
9 fundamental pricing forecast initiates on the order of \$15 per tonne (‘real’
10 [2014] dollars) and was incorporated for not only the ‘BASE’ alternative
11 pricing scenario, but was also applied in the respective ‘Lower Band’ and
12 ‘Higher Band’ alternative scenarios. Hence, the modeling results inherently
13 considered the relative dispatch cost “penalty” attributable to the generation
14 costs of higher-CO₂ emitting coal-fired resources—such as Rockport Unit 2—
15 vis-à-vis other (non-coal) resource alternatives.³⁴ Recognizing this penalty,
16 however, the Plexos® long-term, life cycle study period results previously
17 summarized continued to point to the SCR-retrofit “Option #1” (*either* “Option
18 #1A” or “Option #1B”) as being the least-cost unit disposition option for
19 Rockport Unit 2.

³⁴ It is important to realize, however, that such CO₂ pricing assumptions would naturally have correlative impacts on other commodity pricing; namely the price of natural gas and the price of (PJM) energy.

1 **Q. WERE THE IMPLICATIONS OF EPA’S FINAL CLEAN POWER PLAN**
2 **SPECIFICALLY REFLECTED IN THE MODELED ECONOMIC**
3 **EVALUATIONS FOR ROCKPORT UNIT 2?**

4 A. No, not specifically. Given that the final CPP rulemaking was released
5 relatively recently,³⁵ the states—including Indiana—have yet to potentially
6 offer binding state implementation plans, its underlying complexity, as well as
7 on-going legal challenges; it was not reasonable to attempt to address/model
8 elements of the rule. Moreover, as indicated by Company witness Hendricks,
9 I&M is currently in the process of reviewing these rulemakings and must
10 undertake significant new analyses to understand the impacts of the final
11 CPP working with other stakeholders in the coming months and years to
12 better understand the requirements of the final CPP, and to work with state
13 agencies on the state’s response to it.

14 The final CPP did not seek to establish a carbon price, or “tax”, in order
15 to achieve reduction of CO₂ emissions from fossil generation units. Rather,
16 as more fully described by Mr. Hendricks, the rule is centered on the
17 achievement of future state-specific CO₂ emission reduction targets that were
18 predicated on a set of suggested “building block” metrics. Despite that
19 complexity and uncertainty, it was reasonable to attempt to at least “proxy”
20 the potential relative economic implication on Rockport Unit 2 via assessing
21 the impact of such CO₂/carbon pricing would have on generation/output. This
22 was accomplished through the (incremental) variable/dispatch cost
23 ‘penalization’ of the coal-fired Rockport Unit 2 via the introduction of such a

³⁵ Publicly released on August 3, 2015; and published in the *Federal Register* on October 23, 2015.

1 CO₂/carbon pricing proxy. By way of incorporating these carbon pricing
2 proxies, the Company believes—as supported by the testimony of Mr.
3 Hendricks—it has reasonably estimated the potential impact of the Clean
4 Power Plan on Rockport Unit 2. This includes the incorporation of a “High
5 Carbon” pricing scenario which was determined by the AEP Fundamental
6 Analysis as being a higher-than-anticipated threshold level of CO₂ pricing
7 approximately *two-thirds above* the level assumed in the ‘BASE’ pricing
8 scenario, or at an adjusted level of roughly \$25 per tonne (real [2014] dollars),
9 also effective in the year 2022.

10 **Q. WHAT DID THOSE PLEXOS® MODELING RESULTS INDICATE?**

11 A. As previously summarized in this testimony and on Attachment SCW-4-1,
12 when incorporating a \$15 per tonne (real) CO₂ pricing proxy as part of the
13 “BASE” pricing scenario, the Option #1A alternative continued to be
14 economically advantaged versus either of the “Option #1B” and “Option #2”
15 (return and replace) alternatives by amounts ranging from \$84 million (vs.
16 Option #1B) to \$322 million (vs. Option #2). Alternatively, when incorporating
17 the ‘High Carbon’ \$25 per tonne (real) CO₂ pricing proxy, the Option #1A
18 alternative was now slightly more costly than Option #1B by \$90 million; while
19 it continued to be economically advantaged versus Option #2 by \$142 million.

20 **Q. WHAT ARE THE IMPLICATIONS OF CO₂/CARBON WHEN ASSESSING**
21 **THE RELATIVE *SHORTER-TERM* DECISION AROUND THE ROCKPORT 2**
22 **SCR PROJECT WHEN COMPARING OPTION #2 and OPTION #1B,**
23 **ONLY?**

1 A. Over the relative shorter term, the results suggest that CO₂ would likely not be
2 a significant issue. Recognizing that, effectively, Option #1B and Option #2
3 are *largely focused on the relative economics of those alternatives for the*
4 *years 2020 through 2022 (only)*, one would anticipate that by virtue of a 2022
5 start-date for the CPP (represented by a 2022 carbon tax proxy start-date in
6 the modeling), it would have minimal impact on the relative economic results.
7 This fact is borne out when comparing the relative results found on
8 Attachment SCW-4-2. When examining the (CPW) cost differences between
9 Option #2 and Option #1B, one would note that even under varying long-term
10 commodity pricing scenarios—including “High Carbon” and “No Carbon”
11 scenarios—the results are nearly the same. This indicates that the relative
12 make-up of these respective option views is largely the same post-2022. In
13 other words, both cases assume Rockport Unit 2 would be returned to the
14 Lessors and replaced with comparable (non-coal) resources at that point
15 which would largely mitigate any relative cost exposure tied to CO₂/carbon.

16 Considering further that the recent U.S. Supreme Court decision to
17 stay the CPP could potentially result in the rule’s implementation being
18 delayed by one or more years beyond 2022—under the further assumption
19 that the Court would ultimately re-instate the rule—would suggest that
20 CO₂/carbon will likely have no bearing on this nearer-term decision to install
21 an SCR on Rockport Unit 2.

X. OPTIONALITY OFFERED BY THE ROCKPORT UNIT 2 SCR PROJECT

Q. YOUR TESTIMONY HAS PREVIOUSLY MENTIONED THE “OPTIONALITY” THAT WOULD BE AFFORDED I&M AND ITS CUSTOMERS BASED ON A DECISION TO ALLOW ROCKPORT UNIT 2 TO CONTINUE TO OPERATE BY WAY OF INSTALLING THE SCR PROJECT. PLEASE ELABORATE.

A. The Rockport Unit 2 SCR Project could potentially serve to “bridge” the unit for a period of 9 years; beginning with the required December 2019 SCR in-service date up to the timeframe in which a more capital-intensive DFGD retrofit which, for purpose of the analysis, would be required to be installed by December 31, 2028. For instance—as outlined on TABLE 3—at an installed capital cost of \$189/kW, the Rockport Unit 2 SCR Project would be just a fraction of the cost of either replacement-build CC, CT, AD and/or CHP resources.

Attachment SCW-5, offers a shorter-term (*i.e.*, 13-year; 2016-2028) CPW comparison of the Option #1A versus Option #2 alternatives. It demonstrates that the relative economic advantage of Option #1A versus Option #2 over this shorter timeframe (through 2028) is apparent. That relative CPW benefit is, on average, nearly \$43 million per year—compared to an average per year advantage of nearly \$9 million over the full modeled long-term optimization period, including end-effects. This would suggest that the Rockport Unit 2 SCR Project would offer significant relative option value over the period *leading up to* the next potential major re-investment; the installation of DFGD by the end of 2028.

1 Q. WOULD THIS RELATIVE NEAR-TERM ECONOMIC ADVANTAGE ALSO
2 BE APPLICABLE FOR THE EVEN SHORTER PERIOD LEADING UP TO
3 THE POTENTIAL “RETURN TO LESSOR” DISPOSITION ALTERNATIVE
4 UNDER OPTION #1B?

5 A. Yes, even more so. Attachment SCW-5 also offers a shorter-term (*i.e.*, 7-
6 year; 2016-2022) CPW comparison of the Option #1B versus Option #2
7 alternatives. It demonstrates that the relative economic advantage of Option
8 #1B versus Option #2 over this shorter timeframe (through 2022) is even
9 *more* pronounced, with the CPW benefit being, on average, approximately
10 \$65 million per year.

11 In summary, this would also suggest that the Rockport Unit 2 SCR
12 Project would afford the ability to capitalize on significant relative value it
13 would offer I&M and its customers; even for a brief, 3-year period that would
14 lead up to a potential Return to Lessor disposition.

15 **XI. VALIDATION OF RESULTS VERSUS I&M’S 2015 IRP**

16 Q. EARLIER YOUR TESTIMONY INDICATED THAT THE OPTIONS
17 ANALYZED WERE CONSISTENT WITH CERTAIN “CASES” OFFERED AS
18 PART OF I&M’S RECENT IRP FILING (TABLE 2). HOW DID THE
19 ECONOMIC RESULTS COMPARE BETWEEN THOSE ANALYSES?

20 A. Attachment SCW-6 provides a comparison of the relative CPW differentials
21 between the results set forth in the 2015 IRP³⁶ and these instant results. For
22 example, this demonstrates that the ‘CPW cost difference’ between Option

³⁶ I&M 2015 IRP; Table 22 (pg. 120)

1 #1B and Option #2 under BASE pricing, as shown on Attachment SCW-4-2,
2 was \$239 million. The relative “as-filed” CPW cost difference for the
3 comparable options from the IRP was \$465 million. However, subsequent to
4 the IRP filing it was determined that there was an overstatement of cost of
5 approximately \$205 million in the development of the “Fleet Modification w/
6 NO RK U2 SCR” IRP case results. Therefore the “as-corrected” CPW cost
7 difference is restated at \$260 million, or, nearly the same figure as the current
8 analysis.

9 Also note that the CPW cost difference between Option #1A and
10 Option #1B, as shown also on Attachment SCW-4-1, was \$84 million. The
11 relative “as-filed” CPW cost difference for the comparable options from the
12 2015 IRP was \$174 million. This difference was a function of having utilized
13 an updated set of Rockport Plant long-term projections for plant O&M
14 expense and capital expenditures that was established subsequent to the
15 development of the IRP.

16 **Q. WERE THERE OTHER MATERIAL DIFFERENCES BETWEEN THE**
17 **UNDERLYING DATA PARAMETERS AND ASSUMPTIONS UTILIZED IN**
18 **I&M’s 2015 IRP AND THIS LATEST ROCKPORT UNIT 2 DISPOSITION**
19 **ANALYSIS?**

20 **A.** No. As indicated earlier one of the major underpinnings of such analyses,
21 long-term fundamental commodity pricing projections were the same as those
22 pricing forecasts used in the IRP. Further, the underlying I&M load and peak
23 demand forecast utilized is also identical to the forecast used in the IRP.
24 Additionally, the cost and performance parameters associated with the

1 alternative replacement resources (including, CC, CT, AD, CHP, wind, solar
2 and incremental DSM) were all consistent with the parameters employed in
3 I&M's recently-submitted 2015 IRP.

4 **Q. WOULD THE CONCLUSION THAT INSTALLING AN SCR ON ROCKPORT**
5 **UNIT 2 IS THE SUPERIOR OPTION CHANGE *EVEN IF* DIFFERENT**
6 **ASSUMPTIONS HAD BEEN UTILIZED AS PART OF THIS POST-IRP**
7 **ANALYSIS?**

8 A. No. For instance, as this testimony suggests, if the decision materially boils
9 down to the comparison of two "nearer-term" options—*Option #1B versus*
10 *Option #2*—then both of these options would likely require the same level and
11 type of replacement resources beginning in roughly the same timeframe—
12 2023 (Option #1B) versus 2020 (Option #2). Therefore the relative CPW cost
13 difference between those two views would not be materially impacted
14 *irrespective* of the assumptions supporting those replacement resources—
15 including long-term fundamental pricing and load projections—as each of
16 those options would be impacted nearly equivalently.

17 To validate this point, a sensitivity option was performed which served
18 to "delay" the Rockport Unit 2 replacement resources required under Option
19 #2 by three years (i.e., from 1/2020 -to- 1/2023), or a disposition date
20 *consistent* with Option #1B. As reflected on Attachment SCW-4A, those
21 changes resulted in "(Sensitivity) Option #2A" having relative small CPW cost
22 changes versus Option #2. In fact, under BASE pricing, this Option #2A
23 would now be even more costly versus Option #1A by \$346 million (as

1 compared with a \$322 million CPW cost difference when comparing Option
2 #2 versus Option #1A).

3 Further, recall that when examining the results on Attachment SCW-4-
4 2 the relative CPW cost differences between Option #2 and Option #1B are
5 fairly insignificant (ranging from \$230 million -to- \$272 million, only)
6 *irrespective* of the varied fundamental commodity pricing projection assumed,
7 including natural gas and carbon.

XII. CONCLUSIONS AND RECOMMENDATIONS

8 **Q. DO THE ROCKPORT UNIT 2 DISPOSITION ANALYSES YOU HAVE**
9 **DESCRIBED EXAMINE THE CRITERIA SET FORTH IN INDIANA CODE §**
10 **8-1-8.7-3(b)(7) AND § 8-1-8.7-3(b)(8)?**

11 A. Yes. As it pertains to part (b)(7), the Company has set forth the relative cost
12 and feasibility of a Rockport Unit 2 retirement (or, in this circumstance, return
13 to Lessors) option and demonstrated that the cost of that alternative would
14 exceed that of the proposed Rockport Unit 2 SCR Project.

15 In regard to part (b)(8), the Company has likewise implicitly set forth
16 that the dispatch priority of this proposed NO_x-controlled Rockport Unit 2 will
17 not be adversely impacted based on the resulting variable cost profiles within
18 the economic analyses previously described. It would be anticipated that the
19 unit's annual capacity factor will not be significantly different from levels had
20 this SCR retrofit not been installed.

21 **Q. PLEASE SUMMARIZE YOUR TESTIMONY FROM THE PERSPECTIVE OF**
22 **THE "UNIT DISPOSITION ANALYSES" PERFORMED.**

1 A. Several final summarizations and conclusions can be drawn from the
2 information offered within this testimony:

3 (1) I&M has performed robust unit disposition economic analyses
4 that would point to the nearer-term retrofitting of Rockport Unit
5 2 with SCR technology by December 31, 2019 (via either
6 Option #1A or Option #1B) as being a reasonable and least-
7 cost solution over the long-term economic study period
8 evaluated when compared to a view that would not install an
9 SCR but rather terminate the Rockport Lease as of that same
10 date and paying the Lessors a stipulated Lease Termination
11 Value (Option #2).

12 (2) The Rockport Unit 2 SCR Project would serve to economically
13 preserve a future option to potentially install DFGD
14 environmental controls on Unit 2 by the end of 2028, as
15 required under the Modified Consent Decree. However, even
16 under the assumption I&M would ultimately choose *not* to
17 proceed with a Unit 2 DFGD retrofit, the economic analysis
18 clearly supports implementation of the Rockport Unit 2 SCR
19 Project.

20 (3) It is in the best interest of its customers to leverage the current
21 investment of a thermally-efficient Rockport Unit 2 by
22 recommending it be retrofitted with SCR technology by
23 December 31, 2019, so as to be in compliance with the
24 Modified Consent Decree as well as other potential EPA
25 rulemaking that would require the reduction of NO_x emissions.

26 **Q. DOES THIS CONCLUDE YOUR PRE-FILED DIRECT TESTIMONY?**

27 A. Yes.

VERIFICATION

I, Scott C. Weaver, Managing Director – Resource Planning & Operational Analysis of the American Electric Power Service Corporation, affirm under penalties of perjury that the foregoing representations are true and correct to the best of my knowledge, information and belief.

Date: 10/19/16

Scott C. Weaver

Attachment SCW-1

Overview of resource planning-related criteria used in I&M's analyses

I. RESOURCE NEED

A. Description of I&M's customer base

I&M's customer base consists of both retail and sales-for-resale customers located in northern Indiana and southern Michigan. Approximately 587,000 residential, commercial, industrial and other retail end-use customers are served by the Company; with approximately 459,000 residing in Indiana. These I&M-Indiana retail customers represent over 66 percent of I&M's total (retail and wholesale) energy sales in 2015, with the balance coming from retail sales to customers in Michigan, as well as FERC-authorized sales to several electric cooperatives and municipalities that provide wholesale service for ultimate distribution and resale to their end-use customers.

B. Overview of I&M's peak demand requirements

To ensure the continuation of reliable service, the peak demand of its customer base represents one of the primary underpinnings of any capacity resource plan. The peak load requirement of all I&M retail and sales for resale wholesale customers is seasonal in nature, with distinctive peaks occurring in both the summer and the winter seasons. Historically, I&M's larger peak demand has been recorded in the summer season, with the all-time actual peak being 4,837 MW, which occurred on July 21, 2011 (4,479 MW on a "weather-normalized", non-PJM coincident basis).¹

The following **Table 1-1** offers the AEP Economic Forecasting June, 2015 projection of I&M and, for comparison, overall AEP-East (summer) peak demand and internal load, with peaks adjusted to recognize overall PJM zonal diversity. Over the next 10 year period (through 2025) I&M's summer demand is anticipated to remain relatively flat with a compound annual growth rate ("CAGR") of only 0.04 percent, or by a total of 17 MW; relative results which are below those of the overall AEP-East region for the same period. The peak demand CAGR for I&M does increase to 0.22% over the next 20 years, or by a total of 182 MW.

¹ I&M's most recent annual (2015) actual summer peak was 4,398 MW, occurring on July 28, 2015 (4,528 MW on a weather-normalized, non-PJM coincident basis).

Table 1-1

Compound Annual Growth Rate	0.13%	0.37%

* AEP-East includes Ohio-Wires customers

C. PJM reserve margin criterion

It is assumed that the underlying *minimum* reserve margin criteria to be utilized in the determination of I&M's capacity needs assessment is the PJM board-approved Installed Reserve Margin ("IRM") level. Currently that IRM level is 16.4 percent; but will be increasing to 16.5 percent effective with the most recently-established, 2019/20, PJM (3-year forward) planning year. For long-term resource planning purposes, it is assumed this latter level will remain through the Company's 20-year long-term planning period.

D. I&M and AEP obligation to provide reserve margin in PJM

On October 1, 2004, AEP transferred functional control of its transmission facilities as well as its generation dispatch, including the transmission and generation facilities owned by its operating companies, including I&M, to PJM. With that, the PJM Reliability Assurance Agreement defines the requirements surrounding various reliability criteria, including measuring and ensuring capacity adequacy. In that regard, each Load Serving Entity (“LSE”) in PJM is required to provide an amount of capacity resources determined by PJM based on several factors, including PJM’s IRM requirement. This requirement is itself based on the amount of resources needed to maintain, among other things, a loss-of-load expectation of one day in ten years. Additionally, peak demand diversity among the LSEs and PJM, and generating asset-assumed equivalent forced outage rates (“EFOR”) represent other factors impacting such required minimum reserve levels.

Further, beginning in the initial 2007/08 PJM “planning year”, through today—*i.e.*, for the most recently-established 2019/20 planning year—AEPSC, as agent for the AEP-East LSEs, including I&M, has given annual notice of its intent to elect to continue to opt-out of the PJM Reliability Pricing Model (“RPM”) three-year forward capacity auction and, instead, meet its capacity resource obligation through participation in the optional, FERC-authorized Fixed Resource Requirement (“FRR”) construct. FRR requires AEP and I&M to set forth its future capacity resource profile and position under, essentially, a “self-planning” format that is predicated upon ensuring the stand-alone achievement of its future customer peak demand *plus* IRM requirements (*i.e.*, ‘UCAP Obligation’). The current AEP Power Coordination Agreement (“PCA”) offers a loosely-integrated arrangement in which the participating operating companies (I&M, APCo and KPCo) are expected to be self-sufficient for both capacity and energy requirements. Despite that PCA requirement, these three AEP affiliates have continued to elect to opt-out of the capacity auction and participate jointly as an “FRR” planning entity, at least through the 2019/20 Planning Year, so as to enjoy a) the inherent capacity position hedging capabilities offered to a larger-scale planning entity; and b) a lower overall IRM requirement vis-à-vis the implied reserve margin that have resulted from prior cleared RPM capacity auctions.

Currently it is I&M's position that the interests of its customers are better preserved under that FRR framework. While I&M, and the other AEP-East operating company participants in the PCA—beginning with the *next* (2019/20) PJM-RPM planning year—reserve the option of electing to participate in future RPM 3-year forward auction process.

E. Capacity Performance

On June 9, 2015 FERC issued an order largely accepting PJM's proposal to establish a new "Capacity Performance" product. The resulting PJM rule requires future capacity auctions to transition from current or 'Base' capacity products to Capacity Performance products. Capacity Performance resources would be held to stricter requirements than current Base resources and, with that, could be assessed additional charges for UCAP sources failing to deliver energy when called upon during an (hourly) emergency performance event or, potentially, receive credits if anticipated delivered energy during such events were at levels above offered UCAP amounts for those sources.

I&M and AEP are in the process of reviewing the full implications of the order and recognizing that final tariffs addressing Capacity Performance have not been issued by PJM. Despite this uncertainty, this IRP incorporates the following assumptions for Capacity Performance values as it pertains to certain intermittent resources, in order to address this potential Capacity Performance rulemaking, anticipated to be fully-effective with the 2020/21 PJM planning year:

- Run-of-River hydro unit nameplate capacity will offer no capacity value due to the intermittency of supply.
- Wind resources will also offer no capacity value due to the intermittency of its supply, a reduction from current PJM's criterion limiting UCAP contribution to 13 percent (of nameplate) for new wind sources.
- Solar resources will be valued at the 'full' 38 percent of nameplate capacity rating, which represents the current PJM UCAP limitation criterion for new solar resources.

This long-term I&M capacity profile assumes that during the 2020/21 PJM planning year all capacity resources will need to be Capacity Performance products. *It is possible that these resources may ultimately be combined, or “coupled”, and offered into the PJM market as Capacity Performance resources.* Once the final PJM Capacity Performance tariffs are approved and published, the Company will investigate methods to maximize the utilization of its current (and future) intermittent resource portfolio within that construct. An example could be the additional coupling of run-of-river hydro, wind and potential solar resources in a way that would mitigate non-performance risk. While there could be some uplift in intermittent resource UCAP contribution from such a potential ‘coupling’ approach, it would be anticipated any additional amounts would be negligible in the context of the possible replacement of the Company's 1,105 MW share of Rockport Unit 2.

F. I&M's current available capacity resources

To meet the most recent UCAP Obligation and annual energy requirements of its customers, as part of its FRR obligations in PJM for the current 2016/17 “delivery year”, I&M is relying on 4,524 MW of owned—or for which it currently has a long-term purchase entitlement—generating capability. The make-up of I&M's PJM-recognized installed capability (“ICAP”) includes a portfolio of generating resources identified in the following **Table 1-2**:

Table 1-2

COAL:

- ✓ Rockport Unit 1 (658 MW) located in Spencer County, IN. In-service 1984
- ✓ Rockport Unit 2 (650 MW) located in Spencer County, IN. In-service 1989
- ✓ Rockport Unit 1 (460 MW) located in Spencer County, IN. ² In-service 1984
- ✓ Rockport Unit 2 (455 MW) located in Spencer County, IN. ³ In-service 1989

NUCLEAR:

- ✓ D.C. Cook Unit 1 (1,006 MW) located in Bridgeman, MI. In-service 1975
- ✓ D.C. Cook Unit 2 (1,053 MW) located in Bridgeman, MI. In-service 1978

² This reflects I&M's 70% purchase entitlement from the (50%), AEP Generating Company (AEG) ownership share of the (total) 1315 MW unit.

³ This reflects I&M's 70% purchase entitlement from the (50%), AEG share of the 1300 MW unit that is currently under lease to non-affiliate Lessors.

HYDRO:

- ✓ (41) small, run-of-river units (18 MW total) located at 6 facilities in IN & MI

WIND ⁴:

- ✓ Fowler Ridge Wind Farm (18 MW) located in Benton County, IN. In-service 2009
- ✓ Wildcat Wind Farm (13 MW) located in Grant, Howard, Madison and Tipton Counties, IN. In-service 2013
- ✓ Headwaters Wind Farm (26 MW) located in Randolph County, IN. In-service 12/2014

SOLAR ^{5 6}:

- ✓ Deer Creek Solar facility (1.1 MW) located in Marion, IN. In-service 12/2015

Plus:

- ✓ I&M's 7.85 percent (~166 MW) power participation ratio (PPR) share if the Ohio Valley Electric Corporation's (OVEC) Clifty Creek and Kyger Creek coal-fired facilities (2,140 MW, combined), located in southern IN and southern OH, respectively.

TOTAL (2016/2017 PJM Planning Year) 4,524 MW

Note: Tanners Creek Units 1-4 were retired on June 1, 2015

G. Anticipated future capacity rerates

Nearly concurrent with the planned Rockport Unit 2 (and Unit 1) SCR retrofits in late-2019 and late-2017, respectively, current planning also projects both units would be uprated by a total of 36 MW (each) to reflect the benefits of the AEP System's LP Turbine improvement program. Likewise, D. C. Cook Unit 2 is

⁴ Recognizing the intermittent nature of *wind* resources, for PJM ICAP-determination purposes, this represents the PJM-recognized initial 13 percent portion of the total nameplate rating from I&M's share of the (150-MW, combined) Fowler Ridge I & II Renewable Energy Purchase Agreements (REPA), the (100-MW) Wildcat REPA, and the (200-MW) Headwaters REPA. Note, however, that the subsequent PJM-authorized capacity rating for I&M's share of Fowler I & II has been decreased to a total of 13 MW from the initial in-service recognized level of 19.5 MW (150 MW x 13%). In all cases, however, this 13 percent level of ICAP determination is assumed to be reduced to zero beginning with the full implementation of the PJM-RPM "Capacity Performance" construct effective with the 2020/21 planning year.

⁵ Recognizing the intermittent nature of *solar* resources, for PJM ICAP-determination purposes, this represents the PJM-recognized initial 38 percent portion of the total nameplate rating from I&M's share of the Company-owned (2.9-MW) Deer Creek solar facility. Likewise, however, this 38 percent level of ICAP determination is assumed to remain at 38 percent effective with the full implementation of the PJM-RPM Capacity Performance construct effective with the 2020/21 planning year.

⁶ In addition to the 1.1 MW (2.9 MW nameplate) Deer Creek facility, this does not include three additional I&M solar facilities that are anticipated to be placed into service over the course of 2016, making each not applicable for PJM planning purposes until the subsequent, 2017/18 planning year (Olive solar facility @ 1.9 MW [4.9 MW nameplate]; Twin Branch solar facility @ 1.1 MW [2.9 MW nameplate]; and Watervliet solar facility @ 1.7 MW [4.6 MW nameplate]). This will bring the total solar contribution for I&M in PJM to 5.8 MW (approximately 15 MW nameplate).

projected to experience a 50 MW uprate in late-2016 to reflect a currently-planned HP/LP Turbine replacement. Such uprates would impact the Company's ICAP beginning with the subsequent PJM-RPM planning years.⁷

H. I&M's anticipated "demand" resources (DSM)

Demand-Side Management ("DSM") comprised of both "active" and "passive" demand reduction initiatives has been incorporated into the Company's resource planning. Specifically, "active" DSM, in the form of peak-reducing demand response activity has been projected; as well as "passive" DSM, in the form of "around-the-clock" energy efficiency ("EE") programs, which I&M and this Commission has supported for some time, has also been incorporated in the analysis. The following **Table 1-3** identifies the level of I&M (total) demand reduction and EE that are initially anticipated over the forecasted time horizon. Such projected levels of EE were embedded into the Company's long-term load forecast.

While not at all trivial, it is evident however, that even the aggressive demand resource contributions already forecasted for such DSM activity by or around the year 2020 of 363 MW—summarized in Table 1-3—are well below the significant capacity needs that would be at issue when considering the disposition of units on the scale of, particularly, Rockport Unit 2. Likewise, any incremental levels of DSM/EE activity over-and-above the projected levels incorporated into I&M's long-term load forecast that could result from the unit's disposition evaluation would also likely provide a very small relative offset to the native generation offered to I&M's resource portfolio by Rockport Unit 2 (1,105 MW as reflected in Table 1-2).

⁷ For example, the Rockport Unit 2 (turbine) uprate in "late-2019" would impact I&M's capacity position beginning with the 2020/21 PJM-RPM planning year.

Table 1-3**Forecasted Demand Response (DR) and Energy Efficiency (EE)**

Reflects forecasted DR and EE levels embedded into the Company's June-2015 load & peak demand forecast... This would exclude 'incremental' levels of such resources that would result from the Rockport Unit 2 disposition evaluation performed.

* AEP-East includes Ohio-Wires customers and the prescribed EE reductions through 2025 under Ohio SB 221.

I. SUMMARY: I&M's "GOING-IN" future PJM annual capacity positions

Assuming that the I&M LSE was viewed individually as part of a PJM-planning perspective, the following **Table 1-4** offers a long-term (20-year) overview of such an I&M "stand-alone" capacity position within PJM though the 2035/36 PJM planning year. This view effectively assumes that the Company would continue to elect to participate in the PJM-RPM as an FRR (*i.e.*, self-planning) entity as opposed to participating in PJM's capacity auction construct. Further it assumes, as a "going-in"—or base assumption—that Rockport Unit 2 (and Unit 1) would continue to contribute ICAP throughout the planning horizon. As reflected in the Table 1-4 column identified as "Net Position w/ New Capacity" (col. 20), I&M would be "long" capacity by 159 MW beginning with the most recent (2019/20) 3-year forward PJM-RPM Base Residual Auction planning year.⁸ This demonstrates and confirms that, not surprisingly, I&M would immediately be *significantly* exposed—from a stand-alone planning perspective—should a Rockport Unit 2 disposition strategy call for the unit to be returned to the Lessor.

In summary, based on the recommendations set forth in this testimony and, again, assuming that the I&M LSE were viewed individually as part of a PJM-planning perspective, Table 1-4 offers an overview of such an I&M stand-alone capacity position within PJM assuming the Company would continue to elect to be an FRR planning entity. It offers a "going-in" I&M capacity position profile over the next 20 years—*i.e.*, **before** the addition of incremental Plexos® model-selected resources—that reflect, in addition to the recommended December 2019 "Rockport Unit 2 SCR Project" retrofit, the:

- continued advancement of significant demand-side reduction (see Table 1-3);
- ultimate retrofit of Rockport Unit 1 with SCR and DFGD by December 2017 and December 2025, respectively;
- ultimate retrofit of Rockport Unit 2 with DFGD by December 2028; and
- although no ultimate disposition determination has been made, the potential for the retirement of the first D.C. Cook Nuclear Unit (Unit 1) in 2035 at the end of its initial (20-year) relicensing period.

⁸ Stated another way, I&M would have 159 MW of capacity resources above the minimum PJM-FRR Installed Reserve Margin criterion of 16.5 percent.

- Notes:
- (a) Based on (June 2015) Load Forecast (with implied PJM diversity factor)
 - (b) Existing plus approved and projected "Passive" EE and VVO (note: these values & timing are for reference only and are not reflected in position determination)
 - (c) For PJM planning purposes, the ultimate impact of new DSM is "delayed" - 4 years to represent the ultimate recognition of these amounts through the PJM-originated load forecast process
 - (d) Demand Response approved by PJM in the prior planning year plus forecasted "Active" DR
 - (e) Installed Reserve Margin (RM) = 16.4%(2016), 16.5%(2017-2035) Forecast Pool Requirement (FPR) = (L + RM) * (1 - PJM EFORd)
 - (f) Includes company MLR share of any FPR view of obligations only
 - (g) Reflects the members ownership ratio of following summer capacity assumptions:
 - IRM's share of AEP's EE capacity (63.4% FPR share of 16,430 total capacity)
 - Assessors' share of capacity (36.6% FPR share of 16,430 total capacity)
 - Wind Farm PPAs (Where Applicable)
- (h) Includes company's share of:
- Estimated I&M remuneration for PJM EE (passive) DR program) levels --reflected as a UCAP "resource" as part of PJM's emerging auction products (eff. 2014/15)
 - New wind and solar capacity value is assumed to be 13% and 38% of nameplate
 - Beginning 2009/09, based on 12-month avg. AEP EFORd in eCapacity as of twelve months ended 9/30 of the previous year
 - Represents yearly PJM-originated- forecast of AEP Zonal Load allocated to I&M and other AEP opcos based on SCP
 - Beginning with the 2020/21 P.Y. "Base" UCAP levels will be reduced replaced (effectively reduced) in recognition of the full impact of PJM's "Capacity Performance" tariff. Such reduction impacts being largely anticipated for DR and intermittent (renewable) resources

* As a practical matter, due to poorer thermal efficiency/heat rate, evaporator cooling would be limited during higher temperature periods. Therefore, for dispatch (energy) modeling purposes, a slightly lower 'nominal' rating -- and (lower/improved) attendant Heat Rate -- was utilized throughout the forecast period... However, Max(Sum) "with evaporating cooling" Capability was recognized for purposes of determination of attributable PJM (summer) unfurced capability (UCAP) value.

** Per "BASE" pricing scenario, inclusive of Swing Service Adder.

*** On-Going Capital expenditures are assumed to be incorporated into the Fixed O&M (FOM) estimates shown.

(c) Attachment SCW-4-2

Additional Notes:

o All scenario pricing alternatives (excluding "No CO₂") assume carbon/CO₂ pricing is effective in 2022

- o Option #1A / "Steady State" assume: RK U2 retrofitted w/ SCR (12/19) & DFGD (12/28)

o Option #1B / "Fleet Modification" assume: RK U2 retrofit for SCR only (12/19) then unit returned to Lessor @ 12/2022 and replaced

o Option #2 / "Fleet Modification w/ NO SCR Return assumes: No SCR and unit returned to Lessor 12/2019 and replaced

o Each Rockport unit reflects I&M's 50% (650-MW) Ownership share; plus 70% (455-MW) Purchase. Entitlement from affiliate AEP Generating Cos.' 50% ownership share
