INDIANA UTILITY
REGULATORY COMMISSION

**SOUTHERN INDIANA GAS AND ELECTRIC COMPANY
d/b/a CENTERPOINT ENERGY INDIANA SOUTH
(CEI SOUTH)**

**DIRECT TESTIMONY
OF
JEFFREY T. KOPP
SENIOR MANAGING DIRECTOR, ENERGY & UTILITIES CONSULTING**

ON

DECOMMISSIONING COSTS

**SPONSORING PETITIONER'S EXHIBIT NO. 11,
ATTACHMENTS JTK-1 THROUGH JTK-2**

DIRECT TESTIMONY OF JEFFREY T. KOPP

1 **I. INTRODUCTION**

2 **Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.**

3 A. My name is Jeffrey (“Jeff”) T. Kopp. My business address is 9400 Ward Parkway,
4 Kansas City, Missouri 64114.

5 **Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?**

6 A. I am employed by 1898 & Co., a division of Burns & McDonnell Engineering Company,
7 Inc. (hereinafter called “1898 & Co.”), as the Senior Managing Director of the Energy
8 & Utilities Consulting Department. 1898 & Co. is a business, technology, and security
9 solutions consulting firm serving multiple industries, including the electric power
10 industry. Burns & McDonnell has been in business since 1898, serving multiple
11 industries, including the electric power industry. As a part of Burns & McDonnell, 1898
12 & Co. draws on this over 120 years of engineering experience. In 2023, Engineering
13 News Record (“ENR”) rated Burns & McDonnell No. 7 overall of the Top 500 Design
14 Firms; and the No. 1 engineering design firm in the United States serving the electric
15 power industry.

16 **Q. ON WHOSE BEHALF ARE YOU SUBMITTING THIS DIRECT TESTIMONY?**

17 A. I am submitting testimony on behalf of Southern Indiana Gas and Electric Company
18 d/b/a CenterPoint Indiana South (“CEI South”, “Petitioner”, or “Company”), which is an
19 indirect subsidiary of CenterPoint Energy, Inc.

20 **Q. WHAT IS YOUR ROLE WITH RESPECT TO THIS CASE?**

21 A. I served as the 1898 & Co. project director on the Decommissioning Cost Study
22 (“Decommissioning Study” or “Study”) that included costs for decommissioning,
23 demolishing, and restoring the sites for power generation assets located in Indiana.

24 **Q. PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND.**

25 A. I have a Bachelor’s degree in Civil Engineering from the University of Missouri – Rolla
26 (now the Missouri University of Science and Technology) and a Master of Business
27 Administration from the University of Kansas. I am a registered Professional Engineer
28 in the states of Missouri, Florida, Indiana, and Illinois.

1 **Q. PLEASE DESCRIBE YOUR PROFESSIONAL EXPERIENCE.**

2 A. I am a professional engineer with over 20 years of experience providing consulting
3 services to electric utilities. In my role as a group manager, project director, project
4 manager, and project engineer, I have worked on and have overseen consulting
5 activities for coal, natural gas, wind, solar, energy storage, hydroelectric, and biomass
6 power generation facilities. I have been involved in numerous decommissioning
7 studies and served as project director or project manager on the majority of them. I
8 have helped prepare decommissioning studies on all types of power plants utilizing
9 various technologies and fuels. These decommissioning studies have been utilized in
10 rate cases, to estimate the liability associated with site demolition and retirement at
11 the end of the facilities’ useful lives, to satisfy Financial Accounting Standard (“FAS”)
12 143 (accounting for asset retirement), or for actual asset demolition planning.

13 **Q. WHAT ARE YOUR PRESENT DUTIES AND RESPONSIBILITIES AS SENIOR**
14 **MANAGING DIRECTOR?**

15 A. As the Senior Managing Director of the Energy & Utilities Consulting Department, I
16 oversee a team of nearly 300 project managers, consultants, and engineers, who
17 provide consulting services to clients primarily in the electric power generation and
18 electric power transmission industries, as well as to water, oil and gas, and other
19 industrial and commercial clients. The services provided by this group include
20 decommissioning cost studies, independent engineering assessments of power
21 generation assets, economic evaluations of capital expenditures, new power
22 generation development and evaluation, electric and water rate analysis, electric
23 transmission and distribution planning, generation resource planning, renewable
24 power development, and other related engineering and economic assessments.

25 **Q. HAVE YOU EVER TESTIFIED BEFORE THE INDIANA UTILITY REGULATORY**
26 **COMMISSION (THE “COMMISSION”) OR ANY STATE REGULATORY**
27 **COMMISSION?**

28 A. Yes. I provided written testimony before the Commission in Cause No. 45772 on behalf
29 of Northern Indiana Public Service Company, LLC; Cause No. 45722 on behalf of CEI
30 South; and in Cause No. 45253 on behalf of Duke Energy Indiana, LLC, regarding the
31 decommissioning costs prepared under my direction that were submitted for those
32 Causes. In addition, I have provided testimony regarding power plant
33 decommissioning costs as part of the development of depreciation rates to

1 approximately ten State Regulatory Commissions, the details of which are provided in
2 my resume, Petitioner’s Exhibit No. 11, Attachment JTK-1.

3 **II. PURPOSE & SCOPE OF TESTIMONY**

4 **Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY IN THIS PROCEEDING?**

5 A. The purpose of my testimony is to describe and support the Decommissioning Study
6 prepared by me and my team for power generation assets located in Indiana. The
7 Study was completed, and a report was issued on June 23, 2023. This report sets forth
8 the results of my decommissioning study which is provided as Petitioner’s Exhibit No.
9 11, Attachment JTK-2 (CONFIDENTIAL).

10 **Q. WHAT POWER GENERATION ASSETS DID YOU EVALUATE IN THE**
11 **DECOMMISSIONING STUDY?**

12 A. **Table JTK-1**, below, lists the electric generating assets (“Plants”), and associated fuel
13 types, evaluated as part of the Decommissioning Study. Descriptions of the Plants
14 covered by the Decommissioning Study are provided in Section 3.0 of Petitioner’s
15 Exhibit No. 11, Attachment JTK-2 (CONFIDENTIAL).

Table JTK-1 – Power Generation Assets

Plant	Primary Fuel Type
A.B. Brown Units 3-6 ¹	Natural Gas
Blackfoot Landfill	Landfill Gas
Crosstrack Solar	Solar
F.B. Culley	Coal
Highway 41 Solar	Solar
Oak Hill Solar	Solar
Cause No. 45836 Wind Project ²	Wind
Posey Solar	Solar
Troy Solar	Solar

¹ A.B. Brown Units 5 & 6 represent the two F-class gas combustion turbines (“CTs”) approved in Cause No. 45564.

² Hereinafter, the “45836 Wind Project” or the “Wind Project.”

1 **Q. DID 1898 & CO. VISIT EACH SITE LISTED IN TABLE JTK-1?**

2 A. No. 1898 & Co. visited all sites, excluding Crosstrack and Posey Solar, and the Wind
3 Project, which have not yet reached commercial operation.

4 **Q. PLEASE SUMMARIZE THE RESULTS OF YOUR DECOMMISSIONING STUDY.**

5 A. The total net cost associated with all generating assets was estimated to be
6 \$84,067,200. This amount is stated in 2023 dollars. The breakdown of these costs is
7 presented and discussed in Petitioner’s Exhibit No. 11, Attachment JTK-2
8 **(CONFIDENTIAL)** and summarized in **Table JTK-2**, below:

Table JTK-2 – Power Generation Assets

Plant	Gross Decom Cost	Salvage Credit	Net Project Cost
A.B. Brown Units 3-6	\$ 12,261,000	\$ (5,117,000)	\$ 7,144,000
Blackfoot Landfill	\$ 295,000	\$ (149,000)	\$ 146,000
Crosstrack Solar	\$ 18,975,500	\$ (4,230,800)	\$ 14,744,700
F.B. Culley	\$ 41,515,000	\$ (11,063,000)	\$ 30,452,000
Highway 41 Solar	\$ 457,700	\$ (108,300)	\$ 349,400
Oak Hill Solar	\$ 358,600	\$ (84,700)	\$ 273,900
Wind Project	\$ 11,592,500	\$ (7,368,000)	\$ 4,224,500
Posey Solar	\$ 24,250,000	\$ (5,926,100)	\$ 18,323,900
Troy Solar	\$ 10,667,000	\$ (2,258,200)	\$ 8,408,800
Fleet Total	\$ 120,372,300	\$ (36,305,100)	\$ 84,067,200

9 **Q. ARE YOU SPONSORING ANY ATTACHMENTS IN THIS PROCEEDING?**

10 A. Yes. I am sponsoring the following attachments in this proceeding:

- 11 • Petitioner’s Exhibit No. 11, **Attachment JTK-1**: Resume
12 • Petitioner’s Exhibit No. 11, **Attachment JTK-2 (CONFIDENTIAL)**: CEI South
13 Decommissioning Cost Study, dated June 23, 2023

14 **Q. WERE THESE ATTACHMENTS PREPARED BY YOU OR UNDER YOUR**
15 **SUPERVISION?**

16 A. Yes, they were.

1 **III. BACKGROUND**

2 **Q. WHAT RECOMMENDATION ARE YOU MAKING IN YOUR TESTIMONY?**

3 A. I recommend that the Commission find that the results of the Decommissioning Study
4 are reasonable and appropriate for use as the basis for the cost of removal estimates
5 in the development of depreciation rates for the Plants.

6 **Q. PLEASE DESCRIBE THE DECOMMISSIONING STUDY PREPARED FOR THE**
7 **COMPANY.**

8 A. The Company retained 1898 & Co. to provide a recommendation regarding the total
9 cost, in 2023 dollars, for decommissioning each Plant at the end of its useful life, net
10 of salvage value for scrap materials. Our estimate is inclusive of direct costs
11 associated with decommissioning and demolishing the plant equipment and facilities
12 and restoring the sites to an industrial condition unless otherwise noted in the Study.
13 The direct costs include environmental remediation costs for asbestos removal and
14 other hazardous material handling and disposal, as well as costs for closing any ponds
15 and cleaning up potentially contaminated soil.

16 **Q. WHAT WAS THE EXTENT OF YOUR PERSONAL INVOLVEMENT IN THE**
17 **PREPARATION OF THE DECOMMISSIONING STUDY?**

18 A. I served as the 1898 & Co. project director on the Decommissioning Study. I worked
19 directly with all individuals and parties involved in the preparation of the
20 decommissioning cost estimates in the Decommissioning Study. I was responsible for
21 the overall project and was involved in the development of the dismantling and
22 decommissioning assumptions and cost estimating methodology, preparation and
23 review of the estimates, and preparation and review of the report. In addition, 1898 &
24 Co. representatives and engineers visited the Plants (excluding those noted previously
25 in my testimony) to perform a tour of the facilities with plant personnel to review the
26 equipment, and our team relied on information obtained during those tours in our
27 analyses.

1 **IV. DESCRIPTION OF DECOMMISSIONING COSTS**

2 **Q. EXPLAIN THE TYPE OF COSTS REFLECTED IN A DECOMMISSIONING STUDY.**

3 A. Decommissioning Study cost estimates generally include direct costs associated with
4 decommissioning and demolishing the plant equipment and facilities and restoring the
5 sites to a suitable condition, which in this case was to an industrial condition unless
6 otherwise noted in the Study. The direct costs include environmental remediation costs
7 for asbestos removal and other hazardous material handling and disposal, as well as
8 costs for closing any ponds and removing and disposing of contaminated soil. In
9 addition to these direct costs, decommissioning studies also generally include
10 estimates of indirect costs to be incurred by an entity during decommissioning and
11 contingency costs, both of which I address in the next section of my testimony.

12 **Q. WHAT DOES RESTORING THE SITE FOR INDUSTRIAL USE REQUIRE?**

13 A. In general, restoring a site for industrial use includes the following activities and final
14 site conditions. The site will have all above grade buildings and equipment removed,
15 foundations removed to two feet below existing grade, be rough graded, and seeded.
16 Underground piping will be capped and abandoned in place, except for circulating
17 water piping which will be filled with flowable fill. Ponds will have liners and residuals
18 removed (if applicable) and be graded to match surrounding areas.

19 In most cases, the future use of the site is unknown, so restoring each site to the
20 standard of industrial use allows the Company flexibility regarding the potential future
21 use. The site can alternately remain in this condition in perpetuity. In the case of the
22 specific sites analyzed in the Decommissioning Study, unless otherwise noted in the
23 Study, each plant site is restored to the standard of industrial use. This approach is
24 consistent with our experience with overseeing decommissioning of several power
25 generating facilities and likewise according to the standards we typically assume. It is
26 reasonable to assume the site would be restored to the standard of industrial use as
27 this is a common practice, removes liabilities, and avoids future carrying costs
28 associated with maintaining or ensuring the remaining facilities that could at some
29 point exceed the cost of demolition, while maintaining flexibility of future site use. For
30 example, restoring the site in this manner enables the site to be reused for another
31 power plant, to be redeveloped for industrial use, or to be sold for similar uses. Closure
32 of ash ponds has not been included in the scope of the Decommissioning Study.

1 Recovery of the cost of closing the ash ponds has been addressed in other
2 proceedings.

3 **Q. WHAT APPROACH WAS USED TO DEVELOP THE DIRECT COST ESTIMATES IN**
4 **THE DECOMMISSIONING STUDY?**

5 A. As mentioned prior, the decommissioning cost estimates were developed based on
6 estimates of direct costs, indirect costs, and contingency. The direct decommissioning
7 cost estimates were based on what we would expect an outside contractor, selected
8 through a competitive bidding process, to charge the Company to demolish the site,
9 dismantle all equipment, address environmental issues, and restore the site to a
10 condition suitable for industrial use, based on performing known decommissioning and
11 demolition tasks within the set of assumptions outlined in the Decommissioning Study
12 and under ideal conditions. Site-specific direct cost estimates were developed using a
13 “bottom-up” cost estimating approach, where cost estimates are developed from
14 scratch through the development of site-specific quantity estimates and the application
15 of unit pricing to the quantity estimates. The quantity estimates include but are not
16 limited to items such as tons of steel; pounds of other metals such as copper and
17 stainless steel; tons of debris; cubic yards of concrete; cubic yards of site grading;
18 acres of seeding; and the labor hours required to complete the decommissioning and
19 demolition activities.

20 **Q. WHERE ARE THE ASSUMPTIONS OUTLINED IN THE STUDY?**

21 A. The assumptions applied to the cost estimates are documented in Sections 4.3 and
22 4.4 of the Study, provided as Petitioner’s Exhibit No. 11, Attachment JTK-2
23 **(CONFIDENTIAL)**.

24 **Q. HOW WERE SPECIFIC QUANTITIES AND UNIT PRICING ESTIMATED FOR**
25 **PURPOSES OF ESTIMATING SITE-SPECIFIC DIRECT COSTS?**

26 A. The 1898 & Co. team estimated quantities based on a visual inspection of the facilities,
27 discussions with plant staff, review of engineering drawings, our in-house database of
28 plant quantities, and our professional judgment. Using this information, we estimated
29 quantities and labor hours for the tasks required to decommission and demolish each
30 of the subject facilities. Current market pricing for labor rates, equipment, and unit
31 pricing were then developed for each task. These rates were applied to the quantities
32 for the Plants to determine the total direct cost of decommissioning each site.

1 Additionally, unit pricing for scrap values were applied to the scrap quantities to
2 determine anticipated salvage values, which is addressed later in my testimony.

3 **Q. WHAT SOURCES DID YOU RELY ON TO DEVELOP THE DIRECT COST**
4 **ESTIMATES FOR THE PLANTS?**

5 A. The labor rates, equipment costs, and disposal costs used to develop the Study cost
6 estimates were specific to the locations in which the work is to be performed. These
7 rates were applied to the quantities associated with each Plant to determine the total
8 cost of decommissioning and demolition. Disposal costs were obtained from publicly
9 available information and communications with landfills located in the area in which
10 the work is to be performed to result in estimates that are site-specific and account for
11 local markets, costs, and conditions.

12 The RS Means online database was utilized to obtain labor rates and equipment costs,
13 for the study area. RS Means labor rates are national averages and include site cost
14 indices to provide localized costs to make the costs site specific. RS Means is widely
15 utilized within the construction industry as a tool for estimating and projecting project
16 costs.

17 Pricing developed by the American Metal Market (“AMM”) was also used to develop
18 scrap credits, as discussed in more detail in Section VI of my testimony. The AMM is
19 an industry standard publication routinely relied upon by demolition contractors. Scrap
20 costs also included a deduction for transportation from each site to the selected scrap
21 market in order to result in estimates that are site-specific and account for local
22 markets, costs, and conditions.

23 **Q. ARE THESE SOURCES GENERALLY ACCEPTED IN THE INDUSTRY AND**
24 **RELIED UPON BY OTHER REGULATORY AUTHORITIES IN SETTING**
25 **DECOMMISSIONING COSTS?**

26 A. Yes. These sources are recognized industry-wide, and we have relied on them for the
27 decommissioning cost estimates we have prepared for over 300 plants.

28 **Q. DID YOU CONSIDER WHETHER THE RESALE OF ANY EQUIPMENT WOULD BE**
29 **FEASIBLE TO OFFSET YOUR ESTIMATED DECOMMISSIONING COSTS?**

30 A. Yes. I do not believe resale is feasible due to the limited and opportunistic market for
31 equipment resale. In our recent experience with power plant retirements, it has been

1 difficult to find buyers of used equipment willing to pay more than the scrap value of
2 the equipment because the market for specific buyers with a need for the specific
3 equipment at the time of decommissioning is typically very limited. Furthermore,
4 according to the U.S. Energy Information Administration, nearly 100 gigawatts of
5 fossil-fueled capacity has been retired in the last decade and there are many more
6 plants being retired in the near future, so it is anticipated the market will continue to be
7 flooded with used equipment and the potential buyers of that used equipment would
8 be even further reduced, putting downward pressure on used equipment pricing.
9 Therefore, it is reasonable to assume the expected value of the equipment should be
10 its scrap value.

11 **Q. HAVE YOU RELIED ON THIS SAME METHODOLOGY IN PREPARING**
12 **ESTIMATES OF DECOMMISSIONING COSTS IN THE PAST?**

13 A. Yes. Over the years, we have worked closely with demolition contractors to develop
14 decommissioning cost estimates that align with costs for activities that the demolition
15 contractors will perform. We have prepared numerous decommissioning studies for
16 various clients considering different technologies in several different states and have
17 provided services to clients on decommissioning project execution that has included
18 review and evaluation of bids from demolition contractors. We have utilized this
19 experience preparing decommissioning cost estimates as well as reviewing demolition
20 contractor bids to confirm the reasonableness of the cost estimates we have prepared.

21 In addition, we are able to rely on our firm’s long history, experience and familiarity
22 with demolition practices and construction cost estimates to effectively and accurately
23 estimate costs that are consistent with the industry and trends.

24 **Q. HAVE YOU USED THIS SAME MODEL TO ESTIMATE DECOMMISSIONING**
25 **COSTS FOR FOSSIL FUEL ASSETS IN THE PAST?**

26 A. Yes, I have used the same methodology and model to estimate decommissioning
27 costs for various types of non-nuclear power generating assets. These models were
28 utilized in the development of the cost estimates for each decommissioning and
29 decommissioning study referenced in my resume provided at **Attachment JTK-1**.

30 **Q. DOES YOUR STUDY DICTATE TO THE DEMOLITION CONTRACTOR THE**
31 **ACTUAL DECOMMISSIONING METHODS THAT WILL BE USED TO DISMANTLE**

1 **THESE FACILITIES IN THE FUTURE AND THEREFORE DOES YOUR COST**
2 **ESTIMATE RELY ON THOSE MEANS AND METHODS?**

3 A. No. At the time the Company decides to decommission the Plants, its
4 decommissioning contractor will determine the means and methods by which the
5 decommissioning will occur. It will be the contractor’s responsibility to determine
6 means and methods that result in safely decommissioning and demolishing the Plants
7 at the lowest reasonable cost. However, based on our experience with
8 decommissioning projects, discussions with demolition contractors, and discussions
9 with utilities throughout the United States, the cost estimate we prepared is reflective
10 of what contractors would bid, through a competitive bidding process given the option
11 to select safe and efficient means and methods.

12 **V. PROJECT INDIRECTS AND CONTINGENCY**

13 **Q. WHAT IS INCLUDED IN THE PROJECT INDIRECT COSTS?**

14 A. Indirect costs include those costs expected to be incurred by the Company during the
15 decommissioning process that are in addition to the direct costs paid to demolition
16 contractors. This includes the internal administrative costs (e.g., permitting, fees,
17 Company employee allocated expense) or costs associated with third-party project
18 managers or engineers providing oversight during demolition activities, inspections,
19 and testing to confirm that remediation has been completed.

20 **Q. HOW WERE THE INDIRECT COSTS DETERMINED?**

21 A. Indirect costs were determined as a percentage of the direct costs, as is a typical
22 approach when preparing these types of cost estimates. We developed the
23 percentage of direct costs that was applied to determine the indirect costs based on
24 our experience preparing estimates and managing the execution of decommissioning
25 projects.

26 **Q. WHAT IS INCLUDED IN THE CONTINGENCY COSTS?**

27 A. This category includes costs reasonably expected to be incurred by the Company
28 during the execution of decommissioning and demolition activities in addition to the
29 direct costs. For decommissioning projects, there is uncertainty associated with work
30 conditions and how the work will be performed. There is also some uncertainty
31 associated with estimating the quantities for decommissioning of facilities, due to the

1 age and limits on drawings available, and the absence of testing results for
2 environmental contamination prior to preparation of these types of studies.
3 Contingency costs account for these unspecified but expected costs and are in
4 addition to the direct costs associated with the base decommissioning costs for known
5 scope items.

6 **Q. ARE CONTINGENCY COSTS A NECESSARY COMPONENT OF YOUR COST**
7 **ESTIMATES?**

8 A. Yes. Contingency costs are a critical component for estimating the cost of almost any
9 large construction project. They account for the potential circumstances that can result
10 in an increase in costs over the direct costs for known scope items under ideal
11 conditions. Some of these costs cannot be determined until the decommissioning
12 process has begun. Therefore, contingency is applied on top of the base estimated
13 cost to formulate a reasonable estimate to dismantle the generating facilities.

14 **Q. PLEASE EXPLAIN.**

15 A. It is important to note that many of these decommissioning and demolition projects will
16 not commence until well into the future and site-specific conditions cannot always be
17 identified until decommissioning has commenced. It is not uncommon for unexpected
18 conditions to occur, including but not limited to items such as contractors discovering
19 unaccounted for structures or facilities, like underground storage tanks, after
20 demolition has begun that have to be dismantled, or a greater quantity of contaminated
21 soil than was originally anticipated. Also, the estimated cost to dismantle assumes
22 ideal weather and working conditions, which is an appropriate starting point for cost
23 estimating but realistically cannot be achieved for the duration of a project and can
24 result in cost increases. These types of circumstances can lead to significant increased
25 costs that are difficult to specifically identify this far in advance of a project.

26 **Q. IS INCLUDING CONTINGENCY COSTS IN A DECOMMISSIONING PROJECT**
27 **STANDARD INDUSTRY PRACTICE?**

28 A. Yes. The application of contingency is standard industry practice. Even on a project
29 where firm pricing has been agreed to with a successful bidder, it is typical that a client
30 will carry some level of contingency to cover potential change orders or other
31 unforeseen circumstances associated with a project.

1 **Q. DOES A DECOMMISSIONING PROJECT REQUIRE A HIGHER LEVEL OF**
2 **CONTINGENCY THAN A GREENFIELD CONSTRUCTION PROJECT?**

3 A. Yes. When compared to the contingency assigned to a new construction project, the
4 contingency on a decommissioning project should be higher because older facilities
5 with long operating histories often lack site plans or drawings, well-defined quantities
6 of structural materials, environmental records, or foundation or subsurface information.
7 To that end, the Plants analyzed in this Decommissioning Study will have been
8 inservice for more than 30 to 40 years by the time they are decommissioned.

9 **Q. WHAT CONTINGENCY COSTS ARE YOU RECOMMENDING IN THE**
10 **DECOMMISSIONING STUDY?**

11 A. I have recommended a contingency cost of 20% on top of the direct costs. The
12 percentage was based on similar decommissioning cost contingencies I have
13 prepared for decommissioning projects for other electric utilities that have been
14 approved by regulatory agencies.

15 **VI. SCRAP**

16 **Q. HOW WERE SCRAP VALUES CALCULATED?**

17 A. Scrap metal prices used in the development of the scrap credit were based on a review
18 of current pricing trends for various types of materials published by AMM, which
19 reports the prices paid for scrap metals in transactions worldwide. The salvage value
20 of equipment was included in the cost estimates based on scrap metal prices from the
21 AMM report, less a deduction for transporting the scrap to market. This methodology
22 is appropriate because demolition contractors routinely rely on the values published
23 by AMM to develop the prices they are willing to credit a demolition project for scrap
24 metals because this publication also provides information regarding the price the
25 demolition contractors can expect to receive when they resell the scrap metals to a
26 scrap metal broker or scrap metal processor.

27 **Q. IS AMM A REPUTABLE SOURCE FOR CALCULATING SCRAP PRICING?**

28 A. Yes. AMM is the leading independent supplier of market intelligence and pricing to the
29 North American metals industries and publisher of the widely used reference prices
30 for scrap. AMM has extensive experience in reporting scrap prices in a wide range of
31 grades and locations. AMM has been reporting on the U.S. scrap market for more than

1 100 years, providing benchmark prices to users in the scrap metal industry. AMM
2 develops index prices based on actual transactions, which are reported by market
3 participants conducting scrap metal trades.

4 **Q. WHAT ARE YOUR RECOMMENDATIONS FOR THE VALUE OF SCRAP METAL**
5 **APPLIED IN THE DECOMMISSIONING STUDY?**

6 A. Table 4-1 in the Decommissioning Study, provided at **Attachment JTK-2**
7 **(CONFIDENTIAL)**, shows the scrap metal prices used in the estimates. As noted
8 above, the market value for each type of scrap metal was adjusted to account for
9 transportation costs, in order to determine the net value of the scrap material.

10 **Q. HOW WERE TRANSPORTATION COSTS CALCULATED FOR PURPOSES OF**
11 **VALUING THE SCRAP METAL?**

12 A. Transportation costs include the costs necessary to haul the scrap metal to the scrap
13 market location. Costs for transportation are based on current published railroad tariffs
14 and the costs to truck the material from the site to the rail line.

15 **VII. CONCLUSION**

16 **Q. ARE THE DECOMMISSIONING COSTS SET FORTH IN YOUR TESTIMONY AND**
17 **ATTACHMENT JTK-2 (CONFIDENTIAL) REASONABLE AND NECESSARY**
18 **ESTIMATES FOR PURPOSES OF CALCULATING DEPRECIATION RATES FOR**
19 **THE COMPANY IN THIS PROCEEDING?**

20 A. Yes. These costs are reasonably reflective of the actual costs necessary for the
21 Company to decommission the Plants and are an appropriate basis for setting electric
22 rates in this matter and for the Company to use for planning for decommissioning costs
23 going forward.

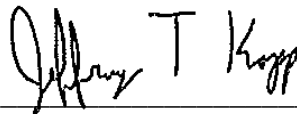

24 **Q. DOES THIS CONCLUDE YOUR PREPARED DIRECT TESTIMONY?**

25 A. Yes, it does.

VERIFICATION

I affirm under penalties for perjury that the foregoing representations are true to the best of my knowledge, information, and belief.

Jeff is the Managing Director of Utility Consulting at 1898 & Co., part of Burns & McDonnell. He and his team specialize in consulting services for power generation and transmission and distribution projects. This includes power plant decommissioning studies, energy project development, due diligence reviews, resource planning, renewable project development, rate studies and analysis, transmission planning, distribution planning, and grid modernization.

PROJECT EXPERIENCE

Decommissioning Study / CenterPoint Energy Indiana South Indiana / 2023

Project director on a decommissioning study for the entire fleet of power generating facilities owned by CenterPoint Energy Indiana South. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives to support regulatory filings. The evaluation included coal-fired plants, natural gas-fired simple and combined cycle units, landfill gas, wind farms, and solar projects. Subsequent to the studies, Jeff will be available to provide written and oral testimony regarding the study findings.

Decommissioning Study / Duke Energy North Carolina, South Carolina, Kentucky, Florida / 2022

Project director on a decommissioning study for the entire fleet of power generating facilities owned by Duke Energy Carolinas, Duke Energy Progress, Duke Energy Kentucky, and Duke Energy Florida. The evaluations were performed to determine the costs to demolish the units and restore the sites at the end of their useful lives to support regulatory filings. The evaluation included coal-fired plants, natural gas-fired simple and combined cycle units, gas fired boilers, hydro-electric plants, and solar projects. Subsequent to the studies, Jeff provided written and oral testimony in Duke Energy rate hearings in and Kentucky regarding the study findings.

Decommissioning Study / Northern Indiana Public Service Co. Indiana / 2022

Project director on a decommissioning study for the entire fleet of power generating facilities owned by Northern Indiana Public Service Company. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives to support regulatory filings. The evaluation included coal-fired plants, natural gas-fired simple and combined cycle units, hydro-electric plants, wind farms, solar farms, and battery energy storage projects. Subsequent to the studies, Jeff provided written and oral testimony in Duke Energy rate hearings in North Carolina and Kentucky regarding the study findings.

TESTIMONY EXPERIENCE

Utility Company	Regulatory Agency	Docket No.	Subject
Energy	The State Corporation Commission of the State of Kansas	Docket No. 23-EKCE-775-RTS	Rate Case - Decommissioning Costs
Duke Energy Kentucky	Kentucky Public Service Commission	Case No. 2022-00372	Rate Case - Decommissioning Costs
Xcel Energy	New Mexico Public Regulation Commission	Case No. 22-00286-UT	Rate Case - Decommissioning Costs
Xcel Energy	Public Utility Commission of Texas	PUC Docket No. 54634	Rate Case - Decommissioning Costs
Evergy Missouri Metro	Public Service Commission of the State of Missouri	Case No. ER-2022-0129	Rate Case - Decommissioning Costs
Northern Indiana Public Service Co	Indiana Utility Regulatory Commission	Cause No. 45772	Rate Case - Decommissioning Costs
Centerpoint Energy Indiana South	Indiana Utility Regulatory Commission	Cause No. 45722	Securitization Filing - Decommissioning Costs
Evergy Missouri Metro	Public Service Commission of the State of Missouri	Case No. ER-2022-0129	Rate Case - Decommissioning Costs
Evergy Missouri West	Public Service Commission of the State of Missouri	Case No. ER-2022-0130	Rate Case - Decommissioning Costs
Florida Power & Light Company	Florida Public Service Commission	Docket No. 20210015-EI	Rate Case - Decommissioning Costs
Duke Energy Florida	Florida Public Service Commission	Docket No. 20210016-EI	Rate Case - Decommissioning Costs
Tampa Electric Company	Florida Public Service Commission	Docket No. 20200264-EI	Rate Case - Decommissioning Costs
Big Rivers Electric Corporation	Kentucky Public Service Commission	2019-00269	Enforcement of Rate and Service Standards - Decommissioning
Xcel Energy	Public Utility Commission of Texas	PUC Docket No. 49831	Rate Case - Decommissioning Costs
Xcel Energy	New Mexico Public Regulation Commission	Case No. 19-00170-UT	Rate Case - Decommissioning Costs
Duke Energy Indiana	Indiana Utility Regulatory Commission	Cause No. 45253	Rate Case - Decommissioning Costs
Calpine Energy	State of New York Board on Electric Generation Siting	Case No. 18-F-0262	Certificate of Environmental Compatibility and Public Need - Decommissioning Costs
Calpine Energy	State of New York Board on Electric Generation Siting	Case No. 16-F-0559	Certificate of Environmental Compatibility and Public Need - Decommissioning Costs
Oklahoma Gas and Electric	The Corporation Commission of the State of Oklahoma	PUD 201800140	Rate Case - Decommissioning Costs
Golden Valley Electric Association	The Regulatory Commission of Alaska	U-18-010	Retirement Report for Healy Unit 1 - Decommissioning Costs
Progress Energy Florida	Florida Public Service Commission	090079-EI	Rate Case - Decommissioning Costs
Otter Tail Power Company	Minnesota Public Utilities Commission	E017/M-10-1082	Advanced Determination of Prudence - AQCS Upgrades
Otter Tail Power Company	Public Service Commission of the State of North Dakota	PU-11-165	Advanced Determination of Prudence - AQCS Upgrades
Xcel Energy	Public Utilities Commission of the State of Colorado	14AL-0660E	Rate Case - Decommissioning Costs
Xcel Energy	Public Utilities Commission of the State of Colorado	16A-0231E	2016 Revised Depreciation Rates
Florida Power & Light Company	Florida Public Service Commission	160021-EI; 160062-EI	Rate Case - Decommissioning Costs
Duke Energy Kentucky	Kentucky Public Service Commission	2017-00321	Rate Case - Decommissioning Costs
Duke Energy Progress	North Carolina Utilities Commission	Docket No. E-2, Sub 1142	Rate Case - Decommissioning Costs
Duke Energy Carolinas	North Carolina Utilities Commission	Docket No. E-7, Sub 1146	Rate Case - Decommissioning Costs
Oklahoma Gas and Electric	Corporation Commission of Oklahoma	Cause No. PUD 201700496	Rate Case - Decommissioning Costs

PROJECT EXPERIENCE

Decommissioning Study / CenterPoint Energy Indiana South

Indiana / 2022

Project director on a decommissioning study for the coal-fired AB Brown plant owned by CenterPoint Energy Indiana South. The evaluation was performed to determine the cost to demolish the unit and restore the site at the end of its useful life to support regulatory filings. Subsequent to the study, Jeff provided written regarding the study findings.

Decommissioning Study / Evergy

Kansas, Missouri / 2021

Project director on a decommissioning study for the entire fleet of power generating facilities owned by Evergy in the States of Kansas and Missouri. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives to support regulatory filings. The evaluation included several coal-fired plants, natural gas-fired simple and combined cycle units, and wind farms. Subsequent to the study, Jeff is available to provide written and oral testimony in Evergy's rate case hearing regarding the study findings.

Decommissioning Study / FPL Energy

Florida, Georgia / 2020

Project manager on a decommissioning study for the entire fleet of power generating facilities owned by FPL Energy and Gulf Power in the States of Florida and Georgia. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives to support regulatory filings. The evaluation included several coal-fired plants, natural gas-fired simple and combined cycle units, and solar generating facilities. Subsequent to the study, Jeff provided written testimony in FPL Energy's rate case hearing regarding the study findings.

Decommissioning Study / Xcel Energy

Colorado / 2020

Project manager on a decommissioning study for the entire fleet of power generating facilities owned by Xcel Energy in the State of Colorado. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives to support regulatory filings. The evaluation included several coal-fired plants,

natural gas-fired simple and combined cycle units, and hydroelectric plants. Subsequent to the study, Jeff was available to provide written and oral testimony in Xcel Energy's rate hearing regarding the study findings.

Decommissioning Study / Apex Clean Energy

New York / 2019

Project manager on a decommissioning study for a wind farm being developed in New York. The evaluation was performed to determine the costs to demolish the units and restore the site at the end of its useful life to support Calpine's application to construct a major electric generating facility under Article 10 of the New York Public Service Law. Subsequent to the study, Jeff provided written testimony in the Article 10 public hearings regarding the study findings.

Decommissioning Study / Calpine

New York / 2019

Project manager on a decommissioning study for a wind farm being developed in New York. The evaluation was performed to determine the costs to demolish the units and restore the site at the end of its useful life to support Calpine's application to construct a major electric generating facility under Article 10 of the New York Public Service Law. Subsequent to the study, Jeff provided written testimony in the Article 10 public hearings regarding the study findings.

Decommissioning Study / Southwestern Public Service

Texas, New Mexico / 2018

Project manager on a decommissioning study for the entire fleet of power generating facilities owned by Southwestern Public Service. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives to support regulatory filings. The evaluation included coal-fired plants, natural gas-fired simple cycle units, and gas fired boiler projects. The report and results are being used in support of depreciation rates as part of the rate case filing. Jeff provided support through the regulatory process with written testimony in Southwestern Public Service's rate hearings regarding the study findings.

Decommissioning Study / Duke Energy Indiana / 2018

Project manager on a decommissioning study for the entire fleet of power generating facilities owned by Duke Energy Indiana. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives to support regulatory filings. The evaluation included coal-fired plants, natural gas-fired simple and combined cycle units, solar projects, and a hydro-electric plant. Jeff provided support through the regulatory process with written testimony in Duke Energy Indiana's rate hearing regarding the study findings.

Decommissioning Study / Golden Valley Electric Association Alaska / 2018

Project manager on a decommissioning study for the entire fleet of power generating facilities owned by Golden Valley Electric Association. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives to support regulatory filings. The evaluation included a coal-fired plant, diesel and naphtha fired combustion turbine units, a battery energy storage facility, and a wind farm. Jeff provided written testimony in Golden Valley's Compliance Hearing regarding the retirement of their Healy Unit 1 project. Jeff also provided written testimony in Golden Valley's rate hearing regarding the study findings.

Decommissioning Study / Owensboro Municipal Utilities Kentucky / 2018

Project manager on a decommissioning study for coal fired generating facility owned by Owensboro Municipal Utilities. The evaluation was performed to determine the options for retiring the plant and associated costs. Options evaluated included placing one of the units into layup with the potential to restart at a later date, retirement in place, or full demolition and site restoration.

Decommissioning Study / Duke Energy Florida / 2018

Project manager on a decommissioning study for the entire fleet of power generating facilities owned by Duke Energy Florida. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives to support regulatory filings. The

evaluation included a coal-fired plant, natural gas-fired simple and combined cycle units, and solar projects. Subsequent to the study, Jeff provided written testimony in Duke Energy Florida's rate hearing regarding the study findings.

Decommissioning Study / Tucson Electric Power Arizona / 2018

Project manager on a decommissioning study for the entire fleet of power generating facilities owned by Tucson Electric Power. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives to support regulatory filings. The evaluation included a coal-fired plant, natural gas-fired simple and combined cycle units, and solar projects. Subsequent to the study, Jeff was available to provide written and oral testimony in Tucson Electric Powers's rate hearing regarding the study findings.

Decommissioning Study / Public Service of New Mexico New Mexico / 2018

Project manager on a decommissioning study for the entire fleet of power generating facilities owned by Duke Energy Florida. The evaluation is being performed to determine the costs to demolish the units and restore the sites at the end of their useful lives to support regulatory filings. The evaluation includes a coal-fired plant, natural gas-fired simple and combined cycle units, and solar projects.

Decommissioning Study / Capital Power Illinois / 2018

Project manager on a decommissioning study for a wind farm being developed in Illinois. The evaluation was performed to determine the costs to demolish the units and restore the site at the end of its useful life to support the county zoning application. Subsequent to the study, Jeff will be available to provide written and oral testimony in the county zoning hearings regarding the study findings.

Decommissioning Study / Calpine New York / 2018

Project manager on a decommissioning study for a wind farm being developed in New York. The evaluation was performed to determine the costs to demolish the units and restore the site at the end of its useful life to support

Calpine's application to construct a major electric generating facility under Article 10 of the New York Public Service Law. Subsequent to the study, Jeff provided written and oral testimony in the Article 10 public hearings regarding the study findings.

Decommissioning Study / Tradewind Energy Illinois / 2018

Project manager on a decommissioning study for a wind being developed in Illinois. The evaluation was performed to determine the costs to demolish the units and restore the site at the end of its useful life to support the county zoning application. Subsequent to the study, Jeff will be available to provided support for the county zoning hearings regarding the study findings.

Decommissioning Study / Hawaii Electric Company Hawaii / 2018

Project manager on a decommissioning study for a reciprocating engine plant that was under construction for Hawaii Electric Company. The evaluation was performed to determine the costs to demolish the units and restore the site at the end of its useful life.

Decommissioning Study / EDP Renewables Indiana / 2018

Project manager on a decommissioning study for a wind farm being developed in Indiana. The evaluation was performed to determine the costs to demolish the units and restore the site at the end of its useful life to support the county zoning application. Subsequent to the study, Jeff provided written and oral testimony in the county zoning hearings regarding the study findings.

Decommissioning Study / EDP Renewables Illinois / 2018

Project manager on a decommissioning study for a wind farm being developed in Illinois. The evaluation was performed to determine the costs to demolish the units and restore the site at the end of its useful life to support the county zoning application. Subsequent to the study, Jeff provided oral testimony in the county zoning hearings regarding the study findings.

Due Diligence / Centerpoint Energy Indiana / 2017

Project manager for a due diligence evaluation of Vectren's fleet of power plants being considered as part of a potential full acquisition of Vectren by Centerpoint. The evaluation included a technical, environmental, and contractual review of the coal, simple cycle, and wind farm facilities. As part of the project, Jeff presented the results of the study to CenterPoint's board of directors to support their decision making process for the acquisition.

Due Diligence / PKA AIP Michigan / 2017

Project manager for a due diligence evaluation of a combined cycle power plant being considered for potential equity investment by PKA AIP. The evaluation included a technical, environmental, and contractual review of the plant.

Decommissioning Study / Tampa Electric Company Florida / 2017

Project manager on a decommissioning study for the entire fleet of power generating facilities owned by Tampa Electric. The evaluation is being performed to determine the costs to demolish the units and restore the sites at the end of their useful lives to support regulatory filings. The evaluation includes a coal-fired plant, natural gas-fired simple and combined cycle units, and solar projects. Subsequent to the study, Jeff will be available to provide written and oral testimony in Tampa Electric's rate hearing regarding the study findings.

Decommissioning Asset Retirement Obligation Study / NRG Energy & Clearway Energy Various US Locations / 2017 - 2020

Project manager on a decommissioning study to evaluate the asset retirement obligation costs for numerous renewable energy facilities owned by NRG Energy throughout the United States. The evaluation was performed to determine the costs for any obligations to remove and/or demolish the facilities and equipment and perform environmental remediation and site restoration activities. The study was performed to support compliance with FAS 143 requirements.

Due Diligence / Confidential Client Northwest / 2017

Project manager for a due diligence evaluation of three natural gas fired combine cycle power plants being considered for potential acquisition. The evaluation included a technical, environmental, and contractual review of the facilities.

Decommissioning Study / Confidential Client Illinois / 2017

Project manager for a site retirement evaluation to help determine the cost to retire a 600 MW coal-fired project in Illinois at the end of its useful life. Estimates for demolition and site restoration were included in the evaluation. Jeff previously prepared decommissioning study estimates for this plant with the updated study being performed to reflect current pricing and changes in regulations.

Decommissioning Study / AEP Ohio, Indiana / 2017

Project manager on a decommissioning study for two coal fired power plants owned by Ohio Valley Electric Company and Indiana Kentucky Electric Company, both of which AEP is the largest shareholder. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives for purposes of accruing the costs over the life of the plants.

Decommissioning Study / OGE Energy Corp. Oklahoma / 2017

Project manager on a decommissioning study for the entire fleet of power generating facilities owned by OGE Energy in Oklahoma. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives to support depreciation rates. The evaluation included several coal-fired plants, natural gas fired boilers, natural gas-fired simple and combined cycle units, and a wind farm. Subsequent to the study, Jeff provided written testimony, and is currently providing support in replying to discovery requests. Jeff will be available to provide oral testimony in OGE Energy's rate hearing regarding the study findings.

Decommissioning Study / Duke Energy North Carolina, South Carolina, Kentucky / 2017

Project manager on a decommissioning study for the entire fleet of power generating facilities owned by Duke Energy Carolinas, Duke Energy Progress, and Duke Energy Kentucky. The evaluations were performed to determine the costs to demolish the units and restore the sites at the end of their useful lives to support regulatory filings. The evaluation included coal-fired plant, natural gas-fired simple and combined cycle units, gas fired boilers, hydro-electric plants, and solar projects. Subsequent to the study, Jeff provided written and oral testimony in Duke Energy rate hearings in North Carolina and Kentucky regarding the study findings.

Useful Life Assessment / Confidential Client Southeast / 2017

Project manager on a useful life assessment for a combined cycle power plant for a confidential client. The evaluation was performed to determine the anticipated life of the facility and associated costs to achieve that life. The study supported financial modeling of the facility as part of the utility's portfolio of assets.

Useful Life Assessment / Confidential Client Southeast / 2017

Project manager on a useful life assessment for a combined cycle power plant for a confidential client. The evaluation was performed to determine the anticipated life of the facility and associated costs to achieve that life. The study supported financial modeling of the facility as part of the utility's portfolio of assets.

Decommissioning Study / FPL Energy Florida / 2015

Project manager on a decommissioning study for the entire fleet of power generating facilities owned by FPL Energy in the State of Florida. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives to support regulatory filings. The evaluation included several coal-fired plants, natural gas-fired simple and combined cycle units, solar generating facilities. Subsequent to the study, Jeff provided written and oral testimony in FPL Energy's rate case hearing regarding the study findings.

Decommissioning Study / Xcel Energy Colorado / 2014

Project manager on a decommissioning study for the entire fleet of power generating facilities owned by Xcel Energy in the State of Colorado. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives to support regulatory filings. The evaluation included several coal-fired plants, natural gas-fired simple and combined cycle units, hydroelectric plants, and a wind farm. Subsequent to the study, Jeff is provided written and oral testimony in Xcel Energy's rate hearing regarding the study findings.

Decommissioning Cost Evaluation / Progress Energy Florida Florida / 2008-2009

Project manager on a site retirement cost evaluation for all the fossil fuel-fired power generating facilities owned by Progress Energy in the state of Florida. The evaluation was performed to determine the costs to demolish the units and restore the sites and included a natural gas-fired steam plants, fuel oil-fired steam plants, natural gas-fired combustion turbines, coal-fired facilities, and combined cycle generating facilities. Subsequent to the study, Jeff provided direct testimony in Progress Energy Florida's rate case regarding the study findings.

Decommissioning Asset Retirement Obligation Study / NRG Energy California / 2016

Project manager on a decommissioning study to evaluate the asset retirement obligation costs for all the fossil fuel-fired power generating facilities owned by NRG Energy in the state of California. The evaluation was performed to determine the costs for any legally obligations to demolish facilities and equipment and perform environmental remediation and site restoration activities. The facilities included a natural gas and fuel oil fired plants consisting of boilers, combustion turbines, and combined cycle generating facilities.

Due Diligence / Confidential Client Northeast / 2016

Project manager for a due diligence evaluation of a portfolio of power generation assets. The assets included gas and oil fired boilers, combined cycle combustion turbines, and simple cycle combustion turbines. The client

was considering acquiring an equity stake in the facilities. The evaluation included a technical, environmental, and contractual review of the facilities. The review primarily focused on evaluation of recent repairs to the facilities, remaining life of the equipment, and potential large capital cost requirements to identify key risks or fatal flaws.

Due Diligence / Confidential Client Northeast / 2016

Project manager for a due diligence evaluation of a coal fired power generating facility that was being offered for sale. The client was considering acquiring an equity stake in the facility. The evaluation included a technical, environmental, and contractual review of the facilities. The review primarily focused on evaluation of the condition of the equipment and facilities, upgrades required to comply with environmental regulations, and other major capital or O&M projects to identify key risks or fatal flaws.

Due Diligence / Confidential Client Northeast / 2016

Project manager for a due diligence evaluation of a combined cycle generating facility under development. The client was considering acquiring an equity stake in the facility. The evaluation included a technical, environmental, and contractual review of the natural gas fired generation facility. The review primarily focused on evaluation of the project costs, schedule, permitting, and other development activities to determine any development risks or fatal flaws.

Decommissioning Study / PacifiCorp Oregon, Washington, Wyoming / 2016

Project manager on a decommissioning study for three wind farms owned by PacifiCorp. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives in support of determining depreciation rates.

Due Diligence / Confidential Client Northeast / 2016

Project manager for a due diligence evaluation of a combined cycle generating facility under development. The client was considering acquiring an equity stake in the facility. The evaluation included a technical, environmental, and contractual review of the natural gas fired generation facility. The review primarily focused on evaluation of the project costs, schedule, permitting, EPC contract,

equipment contracts, and other development activities to determine any development risks or fatal flaws.

Due Diligence / Confidential Client Southeast / 2016

Project manager for a due diligence evaluation of a natural gas fired combined cycle power generating facility that was being offered for sale. The client was considering acquiring an equity stake in the facility. The evaluation included a technical, environmental, and contractual review of the facility. The review primarily focused on evaluation of the condition of the equipment, sufficiency of contractual arrangements, and environmental compliance to identify key risks or fatal flaws

Decommissioning Study / Big Rivers Electric Cooperative Kentucky / 2016

Project manager on a decommissioning study for two coal-fired power generating facilities owned by Big Rivers Electric Cooperative. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives.

Due Diligence / Confidential Client Northeast / 2016

Project manager for a due diligence evaluation of a natural gas fired combined cycle power generating facility that was being offered for sale. The client was considering acquiring an equity stake in the facility. The evaluation included a technical, environmental, and contractual review of the facility. The review primarily focused on evaluation of the condition of the equipment, sufficiency of contractual arrangements, design issues surrounding recent plant performance challenges, and environmental compliance to identify key risks or fatal flaws.

Useful Life Assessment / Confidential Client Southeast / 2015

Project manager on a useful life assessment for a combined cycle power plant for a confidential client. The evaluation was performed to determine the anticipated life of the facility to support financing of the project associated with acquisition of the facility.

Decommissioning Study / Nebraska Public Power District Nebraska / 2015

Project manager on a decommissioning study for five power generating facilities owned by Nebraska Public Power District. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives. The evaluation included two coal-fired plants, a natural gas-fired boiler plant, a combined cycle plant, and a wind farm.

Decommissioning Study / Lafayette Utilities System Louisiana / 2015

Project manager on a decommissioning study for a coal fired generating facility in the state of Louisiana. The evaluation was performed to determine the costs for options to retire the units in place or demolish the units and restore the site now that the units are no longer operating. The costs are being used for planning purposes by the client, to determine the preferred decommissioning plan for the plant.

Decommissioning Study / Colstrip Energy Montana / 2015

Project manager on a decommissioning study for a coal fired generating facility in the state of Montana. The evaluation was performed to determine the costs to demolish the unit and restore the site at the end of its useful life. The costs were used for planning purposes by the client, to determine the decommissioning funds that need to be accrued throughout the operating life of the facility.

Due Diligence / Confidential Client Northeast / 2015

Project manager for a due diligence evaluation of a combined cycle generating facility under development. The client was considering acquiring an equity stake in the facility. The evaluation included a technical, environmental, and contractual review of the natural gas fired generation facility. The review primarily focused on evaluation of the project costs, schedule, permitting, and other development activities to determine whether the project was economically attractive and determine any development risks or fatal flaws.

Decommissioning Study / Apex Clean Energy

Various Locations / 2015

Project manager for a site retirement cost evaluation for three proposed wind energy facilities under development. The evaluation was performed to support permitting activities on the facilities.

Decommissioning Study / Oklahoma Gas & Electric

Oklahoma / 2014

Project manager on a decommissioning study for a power generating facility in the Midwest. The evaluation was performed to determine the costs to demolish the units and restore the site at the end of its useful life. The plant was expected to retire within a year or two of the study, and the costs were used for planning purposes by the client.

Decommissioning Study / Basin Electric Cooperative

North Dakota & Wyoming / 2014

Project manager on a decommissioning study for five power generating facilities in the North Dakota and Wyoming. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful life. The costs are being used for planning purposes by the client.

Coal Plant Layup / Hoosier Energy

Indiana / 2014

Project manager on the preparation of a plan to place a coal fired generating facility in long term layup reserve status. The project included preparation of three manuals for the implementation of the layup plan, maintaining the plant during the layup period, and reactivating the plant at the end of the layup period.

Decommissioning Study / Apex Clean Energy

Illinois / 2014

Project manager for a site retirement cost evaluation for a proposed wind energy facility under development. The evaluation was performed to support permitting activities on the facility.

Decommissioning Study / Confidential Client Midwest / 2014

Project manager for a due diligence evaluation of a combined cycle generating facility under development. The client was considering acquiring an equity stake in the facility. The evaluation included a technical, environmental, and contractual review of the natural gas fired generation facility. The review primarily focused on evaluation of the project costs, schedule, permitting, and other development activities to determine whether the project was economically attractive and determine any development risks or fatal flaws.

Due Diligence / Duke Energy Florida / 2014

Project manager for a due diligence evaluation of the Osprey Energy Center combined cycle generating facility being offered for sale. Duke Energy was considering acquiring the facility from the current owner. The evaluation included a technical, environmental, and contractual review of the natural gas fired generation facility. Duke successfully acquired the facility and utilized the Independent Engineer's Report prepared by 1898 & Co. to support the regulatory process through acquisition of the facility.

Due Diligence / Confidential Client Southeast / 2014

Project manager for a due diligence evaluation of a cogeneration facility being offered for sale. The client was considering acquiring the facility from the current owner. The evaluation included a technical, environmental, and contractual review of the natural gas fired generation facility, including a review of potential modifications to the facility due to the loss of the steam host and associated costs.

Due Diligence / Indiana Municipal Power Agency Indiana / 2014

Project manager for a due diligence evaluation of a coal-fired generating facility being offered for sale. The client was considering acquiring the assets from the current owner. The evaluation includes a technical, environmental, and contractual review of the coal fired generation facility.

Due Diligence / Kansas Municipal Power Agency

Missouri / 2014

Project manager for a due diligence evaluation of a combined cycle generating facility being offered for sale. The client was considering acquiring an equity stake in the facility. The evaluation included a technical, environmental, and contractual review of the natural gas fired generation facility.

Strategic Site Selection Study / Confidential Client

Midwest / 2013

Lead on site selection study for a new natural gas fired combined cycle generating resource in the Midwest. The study included evaluating greenfield and brownfield sites to determine the most attractive sites and the limiting factors to development at each site.

Strategic Site Selection Study / Confidential Client

Northeast / 2013

Lead on site selection study for a new gas processing facility in the northeast. The study included evaluating potential greenfield locations for a cryogenic gas processing plant to handle wet and dry gas from the Utica and Marcellus Shale areas.

Site Evaluations / Confidential Client

Southeast / 2013

Lead on the evaluation of three potential sites for a new natural gas fired combined cycle generating facility in the Southeast. The study included reviewing three sites previously selected by the client and ranking those sites relative to one another to determine their suitability for the natural gas-fired generation options under consideration.

Decommissioning Study / Arizona Public Service

Arizona / 2013

Project manager on a decommissioning study for a four-steam electric generating facilities in the southwest. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives. The evaluation included two coal-fired plants, and two natural gas and fuel oil fired boilers.

Decommissioning Study / Confidential Client

Texas / 2013

Lead on a decommissioning study for a coal fired generating facility in Texas. The study included evaluating options to place the plant in reserve shutdown status or completely retire the plant and perform full plant demolition.

Decommissioning Study / Confidential Client

Upper Midwest / 2013

Project manager on a decommissioning study for a coal fired generating facility in the upper Midwest. The study included phasing the retirement dates of portions of the facility and performing selective demolition as appropriate with full demolition to be complete at the end of useful life of the entire facility. The study also included evaluating potential value of equipment for sale on the secondary market.

Decommissioning Study / Confidential Client

Ohio River Valley / 2013

Project manager on a decommissioning study for two coal fired generating facilities in the Ohio River Valley. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful life. The costs are being used for planning purposes by the client.

Decommissioning Study / EDP Renewables

Illinois / 2013

Project manager on a decommissioning study for a wind farm being developed in New York. The evaluation was performed to determine the costs to demolish the units and restore the site at the end of its useful life to support Calpine's application to construct a major electric generating facility under Article 10 of the New York Public Service Law. Subsequent to the study, Jeff will be available to provide written testimony in the Article 10 public hearings regarding the study findings.

Strategic Site Selection Study / Confidential Client

Western Kansas / 2012

Lead on a strategic site selection study for a new natural gas fired generation resource in the state of Kansas. The

study resulted in the identification of multiple viable site alternatives to support the natural gas-fired generation options under consideration.

Due Diligence / Confidential Client Northeast / 2012

Project manager for a due diligence evaluation of a coal-fired generating facility being offered for sale. The client was considering acquiring the assets from the current owner. The evaluation includes a technical, environmental, and contractual review of the coal fired generation facility.

Due Diligence / Old Dominion Electric Cooperative Pennsylvania / 2012

Jeff provided support for a due diligence evaluation of a facility under development, that included a 2-on-1 combined cycle power block, being offered for sale. The client was considering acquiring the site from the current owner. The evaluation included a technical, environmental, and contractual review of the combined cycle generation facility. The evaluation included a review of existing agreements and permits in place to facilitate development of the generation resource. The project also included a review of the project capital costs to determine whether the costs were reasonable, and to identify any gaps that may increase the overall project cost.

Due Diligence / Old Dominion Electric Cooperative New Jersey / 2012

Project manager for a due diligence evaluation of a facility that was under construction at the time, and was being offered for sale. The client was considering acquiring the 2-on-1 combined cycle power generating facility, from the current owner. The evaluation included a technical, environmental, and contractual review of the including a review of existing agreements and permits in place. The project also included a review of the project capital costs to determine whether the costs were reasonable, and to identify any gaps that may increase the overall project cost.

Due Diligence / Old Dominion Electric Cooperative Virginia / 2012

Project manager for a due diligence evaluation of a facility under development, that included a 2-on-1 combined cycle

power block, being offered for sale. The client was considering acquiring the site from the current owner. The evaluation included a technical, environmental, and contractual review of the combined cycle generation facility. The evaluation included a review of existing agreements and permits in place to facilitate development of the generation resource. The project also included a review of the project capital costs to determine whether the costs were reasonable, and to identify any gaps that may increase the overall project cost.

Due Diligence / Confidential Client Southeast / 2012

Jeff assisted with a due diligence evaluation of a facility that includes two, 2-on-1 combined cycle power blocks, being offered for sale. The client was considering acquiring the assets from the current owner. The evaluation included a technical, environmental, and contractual review of the combined cycle generation facility.

Development Assistance / Tenaska Ohio / 2012

Project manager assisting a client with the preparation of a Certificate of Environmental Compatibility and Public Need for conversion of an existing simple cycle facility to combined cycle. The facility includes five combustion turbines, four of which will be converted to two, 2-on-1 combined cycle power blocks. The project includes full preparation of the Certificate of Environmental Compatibility and Public Need application, as well as public meeting support.

Repower Assessment / Confidential Client North Dakota / 2011

Jeff assisted a client with an evaluation comparing the economic viability of retrofitting an existing coal-fired power plant with air quality control system equipment in comparison to replacing the plant with new natural gas fired generation. The project includes preparing capital cost estimates; operating and maintenance cost estimates, and determining the net present value of each alternative evaluate the relative economic attractiveness of each alternative.

Decommissioning Study / Progress Energy North Carolina & South Carolina / 2011

Project manager on a decommissioning study for the entire fleet of power generating facilities owned by Progress Energy Carolinas. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives. The evaluation included several coal-fired plants, as well as several natural gas-fired and fuel oil-fired units.

Decommissioning Study / Minnesota Power Minnesota / 2011

Project manager on a decommissioning study for several power generating facilities owned by Minnesota Power. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives. The evaluation included three coal-fired plants and a biomass fired facility.

Strategic Site Selection Study / Old Dominion Electric Cooperative Virginia, Maryland, Pennsylvania, Delaware / 2011

Project manager on a strategic site selection study for a 750 MW combined cycle facility. The study resulted in the identification of multiple viable site alternatives to support the natural gas-fired generation option under consideration.

Due Diligence Evaluation / Old Dominion Electric Cooperative Pennsylvania / 2011

Project manager on a due diligence evaluation of a 2-on-1 combined cycle facility being offered for sale by Liberty Electric in Pennsylvania. The client was considering acquiring the assets from the current owner. The evaluation included a technical, environmental, and contractual review of the combined cycle generation facility.

Due Diligence Evaluation / Tyr Energy Florida / 2011

Project manager on a due diligence evaluation of a biomass power generating facility under development by American Renewables. The client was considering an equity

investment in the facility. The evaluation included a 100 MW bubbling fluidized bed boiler and steam turbine.

Due Diligence Evaluation / Electric Cooperative Maryland / 2011

Project manager on a due diligence evaluation of a combined cycle facility under development in Maryland. The client was considering acquiring the site and all the development rights for installation of a 2-on-1 combined cycle facility. The evaluation included a review of existing agreements and permits in place to facilitate development of the generation resource.

Decommissioning Study / Tampa Electric Co. Florida / 2011

Project manager on a decommissioning study for the power generating facilities owned by Tampa Electric Company. The evaluation was performed to determine the costs to demolish the units and restore the sites at the end of their useful lives. The evaluation included a coal-fired plant, an integrated gasification combined cycle plant, and several natural gas-fired units.

Decommissioning Study / Confidential Client Illinois / 2011

Project manager for a site retirement evaluation to help determine the cost to retire a 600 MW coal-fired project in Illinois at the end of its useful life. Estimates for demolition and site restoration were included in the evaluation.

Repower Assessment / Confidential Client Minnesota / 2010

Jeff assisted a client with an evaluation comparing the economic viability of retrofitting an existing coal-fired power plant with air quality control system equipment in comparison to replacing the plant with new natural gas fired generation. The project includes preparing capital cost estimates; operating and maintenance cost estimates, and determining the net present value of each alternative evaluate the relative economic attractiveness of each alternative.

Biomass Plant Site Selection Study / Confidential Client Texas / 2010

Project manager for a Site Selection Study for a Biomass project to be located in Texas. The project included ranking of candidate sites to determine a preferred site for development of a 20 MW biomass power generating facility.

Due Diligence Evaluation / Tyr Energy Multiple Locations / 2010

Project manager on a due diligence evaluation for several natural gas-fired facilities being offered for sale by Tenaska. The client was considering an equity investment in the facilities. The evaluation included four combined cycle facilities and one simple cycle facility.

Power Plant Valuation Assessment / Basin Electric Power Cooperative North Dakota / 2010

Project manager to provide a valuation assessment of the Antelope Valley Station Unit 2, which is being considered for purchase by Basin Electric Power Cooperative. The project includes valuing the 25 year old 450 MW coal fired unit in current dollars and at specified dates in the future.

Wind Farm Evaluation / Minnesota Power North Dakota / 2010

Project manager to provide an evaluation of a proposed wind farm development in central North Dakota. The project includes wind resource assessments, conceptual engineering design, capital cost estimates, and estimated busbar costs for development of wind farm project in phases on the land currently under contract.

Decommissioning Cost Evaluations / Horizon Wind Energy Midwest / 2008-2010

Project manager on multiple site retirement cost evaluations for several proposed wind energy facilities under development by Horizon Wind Energy. The evaluations were performed to support permitting activities on the facilities.

Due Diligence Evaluation / Tyr Energy Hawaii / 2010

Project manager on a due diligence evaluation for a biomass gasification generating facility under development in Hawaii. The client was considering the facility for investment. The evaluation included a Primenergy gasifier with a net plant output of approximately 12 MW.

Project Development Assistance / Tradewind Energy Kansas / 2009-2010

Project manager to provide development assistance on a wind farm facility in Southern Kansas. The development assistance includes support on land acquisition efforts for the project, transmission line routing and preliminary design, power collection system preliminary design, and general project development assistance.

Project Development Assistance / Tradewind Energy Missouri / 2007-2010

Project manager to provide development assistance on two wind turbine facilities in Northern Missouri. The development assistance includes support on land acquisition efforts for the project, transmission line routing and preliminary design, power collection system preliminary design, and general project development assistance.

Decommissioning Cost Evaluation / Northern Indiana Public Service Co. Indiana / 2008

Project manager on a site retirement cost evaluation for several generating facilities owned by NIPSCO. The evaluation was performed to determine the costs to demolish the units and restore the sites and included several coal-fired facilities and a combined cycle generating facility.

Due Diligence Evaluation / Grays Harbor Public Utility District Washington / 2008

Project manager on a due diligence evaluation for a biomass-fired cogeneration facility being offered for sale in Washington. The facility evaluated was a paper mill that had been shutdown for several years. The facility included

a wood waste fired boiler that provided steam to a steam turbine for electric power generation as well as providing plant process steam.

Due Diligence Evaluation / Tyr Energy New Mexico / 2008

Project manager on a due diligence evaluation for a natural gas-fired power generating facility being offered for sale in New Mexico. The evaluation included two Mitsubishi 501F combustion turbines operating in combined cycle mode.

Decommissioning Cost Evaluation / Horizon Wind Energy Illinois / 2008

Project manager on a site retirement cost evaluation for a wind farm being proposed by Horizon Wind Energy in Illinois. The evaluation was performed to determine the costs to demolish the units and restore the sites to meet the county zoning requirements.

Due Diligence Evaluation / Tyr Energy Western U.S. / 2008

Project manager on a due diligence evaluation for several natural gas-fired power generating facilities being offered for sale throughout the western United States. The evaluation included several GE LM6000 combustion turbines operating in simple cycle mode, several GE LM6000 combustion turbines operating in combined cycle mode, one GE 7EA combustion turbine operating in combined cycle mode, and one GE 7FA combustion turbine operating in simple cycle mode.

Due Diligence Evaluation / Tyr Energy Virginia / 2007

Project manager on a due diligence evaluation for a generating facility being offered for sale in Virginia. The evaluation included 7 GE LM6000 fuel oil fired combustion turbines operating in simple cycle mode.

Due Diligence Evaluation / Tyr Energy Colorado / 2007

Project manager on a due diligence evaluation for 5 GE LM6000 combustion turbines operating in combined cycle cogeneration mode with 2 steam turbines. The facility

includes a greenhouse that serves as the plant's thermal host for cogeneration operations.

Project Development Assistance / Mesa Wind Power Texas / 2007

Jeff provided development assistance on a 4,000 MW wind turbine facility located in the panhandle of Texas. The development assistance includes pro forma economic modeling of the project.

Due Diligence Evaluation / Kelson Energy Ohio / 2007

Project manager on a due diligence evaluation for a generating facility being offered for sale in Ohio. The evaluation included a partially constructed 2x1 Siemens Westinghouse 7FA combined cycle generating facility.

Due Diligence Evaluation / Grand River Dam Authority Oklahoma / 2007

Project manager on a due diligence evaluation for a generating facility being offered for sale in Oklahoma. The evaluation included a 4x2 GE 7FA combined cycle generating facility.

Due Diligence Evaluation / Brazos Electric Power Cooperative Texas / 2007

Project manager on a due diligence evaluation for the purchase of an equity share of a generating facility being constructed in Texas. The evaluation included an 890 MW supercritical pulverized coal fired generating facility.

Due Diligence Evaluation / Tyr Energy Florida / 2007

Project manager on a due diligence evaluation for a generating facility being offered for sale in Florida. The evaluation included 3 GE 7FA combustion turbines operating in simple cycle mode. .

Cost Estimate Preparation / Direct Energy Texas / 2007

Project manager for the preparation of planning level cost estimates for a new combined cycle facility to be constructed in Texas.

Due Diligence Evaluation / Tyr Energy Various U.S Locations / 2007

Project manager on a due diligence evaluation for several generating facilities being offered for sale throughout the U.S. The evaluation included a coal, natural gas, and wind power facilities.

Owner's Engineer Services / Grays Harbor PUD

Washington / 2007

Project manager on an owner's engineer project to evaluate the plans for installation of a refurbished steam turbine at a paper mill. The evaluation included the review of the design for the installation of a 7 MW steam turbine.

Decommissioning Cost Evaluation / Tyr Energy

Various U.S Locations / 2007

Project manager on a site retirement cost evaluation for several generating facilities owned by Tyr Energy. The evaluation was performed to satisfy FASB 143 accounting standards and included a simple cycle and combined cycle generating facilities.

Due Diligence Evaluation / Tyr Energy Virginia / 2006-2007

Project manager on a due diligence evaluation for a generating facility being offered for sale in Virginia. The evaluation included a 240 MW subcritical pulverized coal fired facility.

Due Diligence Evaluation / Brazos Electric Power Cooperative

Texas / 2006

Project manager on a due diligence evaluation for a generating facility being offered for sale in Texas. The evaluation included a 1x1 GE 7FA combined cycle

generating facility and 2 GE 7FA combustion turbines operating in simple cycle mode.

Due Diligence Evaluation / Kelson Energy Ohio / 2007

Project manager on a due diligence evaluation for a generating facility being offered for sale in Ohio. The evaluation included a partially constructed 2x1 Siemens Westinghouse 7FA combined cycle generating facility.

Generation Alternatives Study / Ottertail Power Company

North Dakota / 2006

Project manager on a Generation Alternatives Study for the addition of a new 600 MW coal fired unit at an existing coal fired facility. The study includes a pro forma analysis of the technologies considered.

Technology Assessment / Minnesota Power South Dakota / 2006

Assisted with a technology assessment for the addition of a new 500 MW coal fired unit at an existing coal fired facility. The study includes a pro forma analysis of the technologies considered.

Technology Assessment & Feasibility Study / Ottertail Power Co.

Minnesota / 2006

Project manager on a feasibility study and technology assessment for the addition of a new 500 MW coal fired unit at an existing coal fired facility. The study includes conceptual site layouts, cost estimates, performance estimates, and water balances.

Project Development Assistance / Tradewind Energy

Kansas / 2005-2006

Project manager to provide development assistance on a 250MW wind turbine facility in Central Kansas. The development assistance includes conceptual design and technical support for the development phase of the project.

**Siting Study & Technology Assessment /
Arizona Public Service****Arizona/New Mexico / 2005-2006**

Assisted with a siting study and technology assessment for a 1,800 MW coal fired facility in Arizona and Northwestern New Mexico. Development resulted in the identification of multiple viable site alternatives to support coal-fired generation options.

Due Diligence Evaluation / Tyr Energy**California / 2005-2006**

Project manager on a due diligence evaluation for four generating facilities being offered for sale in California. The evaluation included simple cycle facilities consisting of Pratt & Whitney FT8 Twinpacs. **Professional Services: 2005-2006**

**Waste-to-Energy Feasibility Study / CPS
Energy****Texas / 2005**

Assisted with a feasibility study for a new waste-to-energy facility in the State of Texas. The study included a pro forma analysis of the facility considered.

Due Diligence Evaluation / Tyr Energy**Oklahoma / 2006**

Project manager on a due diligence evaluation for a generating facility being offered for sale in Oklahoma. The evaluation included a simple cycle facility consisting of four General Electric 7EA turbines.

Due Diligence Evaluation / Cinergy**Indiana / 2005**

Project manager on a due diligence evaluation for a generating facility being offered for sale in Indiana. The evaluation included a simple cycle facility consisting of four Siemens Westinghouse 501D5A turbines.

Due Diligence Evaluation / kRoad Power**Various Locations / 2003-2004**

Project manager on due diligence evaluations for several generating facilities being offered for sale throughout the United States. The evaluations included four combined cycle plants utilizing Siemens Westinghouse 501G turbines.

**Due Diligence Evaluation / kRoad Power
Various Locations / 2003**

Project manager on due diligence evaluations for several generating facilities being offered for sale by Duke Energy. The evaluations included two combined cycle plants and one simple cycle plant utilizing General Electric 7FA turbines and General Electric 7EA turbines respectively.

**Decommissioning Cost Evaluation / Old
Dominion Electric Cooperative****Maryland/Virginia / 2002-2004**

Project manager on several site retirement evaluations to help determine the cost to retire the facilities at the end of their useful life. The evaluations included simple cycle plants utilizing General Electric 7FA turbines and Caterpillar Diesel Gensets. Estimates for demolition and site restoration were included.

**Decommissioning Cost Evaluation / Western
Farmers Electric Cooperative****Oklahoma / 2004**

Project manager on a site retirement evaluation to determine the approximate cost to retire the facilities, prepare demolition contract documents, and evaluate bids. The evaluation included a dual fuel genset site.

**Decommissioning Cost Evaluation / Panda
Energy****North Carolina / 2003**

Project manager on a site retirement evaluation to help determine the cost to retire the Panda-Rosemary Project at the end of its useful life. The evaluation included a combined cycle cogeneration facility in Roanoke Rapids, North Carolina. Estimates for demolition and site restoration were included in the evaluation.

**Independent Engineer's Report / Panda
Energy****North Carolina / 2003-2004**

Produced an Independent Engineer's Report for the Panda-Rosemary Project. The report included a due diligence evaluation of plant performance and financial assessment of a combined cycle cogeneration facility in Roanoke Rapids, North Carolina.

Decommissioning Cost Evaluation / Sempra Energy**Arizona / 2003**

Provided a site retirement evaluation to help determine the cost to retire the Mesquite Energy Generating Facility at the end of its useful life. The evaluation included a combined cycle plant near Phoenix, Arizona. Estimates for demolition and site restoration were included in the evaluation.

Feasibility Study / Northeast Utility Service Corp**New Hampshire / 2004**

Assisted with a feasibility study to replace an existing coal-fired unit with a new coal fired unit. The study included the installation of a single 600 MW unit in New Hampshire. A pro forma analysis of the new unit was prepared and benchmarked against a pro forma analysis for the existing unit.

Technology Assessment & Feasibility Study / Ottertail Power Corp**South Dakota / 2006**

Assisted with a technology assessment and feasibility study for a new coal-fired generation facility in South Dakota. The study included a pro forma analysis of the alternative technologies considered.

Waste-to-Energy Feasibility Study / CPS Energy**Texas / 2005**

Assisted with a feasibility study for a new waste-to-energy facility in the State of Texas. The study included a pro forma analysis of the facility considered.

Technology Assessment & Feasibility Study / Progress Energy**Florida / 2004**

Assisted with a technology assessment and feasibility study for new solid fuel fired generation in the State of Florida. The study included a pro forma analysis of the alternative technologies considered.

Resources Corporation Project Development Assistance / Peoples Energy**Oregon / 2001-2004**

Provided project development assistance for a 1,200 MW combined cycle power plant in Oregon. Mr. Kopp assisted in the preparation of an Energy Facility Site Certificate including preliminary engineering design, preparation and review of written exhibits, and public presentation support.

Project Development Assistance / Peoples Energy Resources Corporation**New Mexico / 2001-2004**

Provided project development assistance for a simple cycle power plant in New Mexico. Mr. Kopp provided preliminary engineering design and project development assistance. This included preparing preliminary site design drawings that were approved by the county zoning commission during the site design review process as well as public presentation support.

1.0 EXECUTIVE SUMMARY

1.1 Introduction

CenterPoint Energy Indiana South ("CEI South") retained 1898 & Co., a division of Burns & McDonnell Engineering Company, Inc. (hereinafter called "1898 & Co."), to conduct a Decommissioning Cost Study ("Study") for power generation assets ("Plants") located in Indiana. The assets include natural gas-fired, coal-fired, landfill gas, wind, and solar generation facilities. The purpose of the Study was to review the facilities and to make a recommendation to CEI South regarding the total cost to decommission the facilities at the end of their useful lives. The decommissioning costs were developed by 1898 & Co. using information provided by CEI South and in-house data available to 1898 & Co.

1.2 Results

1898 & Co. has prepared cost estimates in 2023 dollars for the decommissioning of the Plants. These cost estimates are summarized in the following Table. When CEI South determines that the Plants should be retired, the above grade equipment and steel structures are assumed to have sufficient scrap value to a scrap contractor to offset a portion of the decommissioning costs. CEI South will incur costs in the demolition and restoration of the sites less the scrap value of equipment and bulk recycled metals.

Table 1-1: Decommissioning Cost Summary (2023\$)¹

Plant	Gross Decom Cost	Salvage Credit	Net Project Cost
A.B Brown Units 3-6	\$ 12,261,000	\$ (5,117,000)	\$ 7,144,000
Blackfoot Landfill	\$ 295,000	\$ (149,000)	\$ 146,000
Crosstrack Solar	\$ 18,975,500	\$ (4,230,800)	\$ 14,744,700
F.B. Culley	\$ 41,515,000	\$ (11,063,000)	\$ 30,452,000
Highway 41 Solar	\$ 457,700	\$ (108,300)	\$ 349,400
Oak Hill Solar	\$ 358,600	\$ (84,700)	\$ 273,900
██████████ Wind	\$ 11,592,500	\$ (7,368,000)	\$ 4,224,500
Posey Solar	\$ 24,250,000	\$ (5,926,100)	\$ 18,323,900
Troy Solar	\$ 10,667,000	\$ (2,258,200)	\$ 8,408,800
FLEET TOTAL	\$ 120,372,300	\$ (36,305,100)	\$ 84,067,200

The total project costs presented above include the costs to return the sites to an industrial condition suitable for reuse for development as an industrial facility. Included are the costs to dismantle all power generating equipment and balance of plant ("BOP") facilities and, where applicable, to perform environmental site restoration activities.

¹ Warrick Generating Station is a coal-fired generating facility located in Warrick County, Indiana. The Plant has 4 units, the fourth of which is jointly owned by CenterPoint and Alcoa. Under the joint operating agreement for Warrick, Alcoa is responsible for decommissioning the facility. As such, Warrick is not included in the scope of this Study.

2.0 INTRODUCTION

2.1 Background

1898 & Co. was retained by CEI South to conduct a Study to estimate the decommissioning costs. The assets include natural gas-fired, coal-fired, landfill gas, wind, and solar generating facilities. Individuals from 1898 & Co. visited a representative portion of the Plants evaluated within the Study in March of 2023. The purpose of the Study was to review the facilities and to make a recommendation to CEI South regarding the total cost to decommission and dismantle the facilities at the end of their useful lives. 1898 & Co. has prepared over three hundred decommissioning studies on various types of fossil fuel and renewable power plants. In addition to preparing decommissioning cost estimates, 1898 & Co. has supported demolition projects as the owner's engineer. In this capacity, 1898 & Co. has evaluated demolition bids and overseen demolition activities. This has provided 1898 & Co. with insight into a broad range of competitive demolition bids, which also assists in confirming the validity of the decommissioning and dismantling estimates developed by 1898 & Co.

2.2 Methodology

The sites decommissioning costs were developed using information provided by CEI South and in-house data 1898 & Co. has collected from previous project experience. 1898 & Co. estimated quantities for equipment based on a visual inspection of the facilities, reviews of engineering drawings, an in-house database of plant equipment quantities, and professional judgement. For each Plant, quantities were estimated for each required task. Current market pricing for labor rates and equipment was then developed for each task. The unit pricing was developed for each site based on labor rates, equipment costs, and disposal costs specific to the area in which the work is to be performed. These rates were applied to the quantities for the Plants to determine the total cost of decommissioning and dismantling.

The decommissioning costs include the cost to return the site to an industrial condition, suitable for reuse for development of an industrial facility. Included are the costs to decommission and dismantle all the assets owned by CEI South at the sites, including power generating equipment and Balance of Plant facilities.

2.3 Site Visits

Representatives from 1898 & Co. and CEI South visited the sites in March of 2023. A representative portion of the sites was visited. The site visits consisted of a tour of each facility along with Larry Rogers, John Harris, and plant personnel at each of the sites.

The following 1898 & Co. representatives comprised the site team:

- Mr. Stephen Henson, Project Lead
- Mr. Moh EL Naamani, Project Engineer
- Mr. Dennis O'Connor, Project Analyst

The following Table includes the Plants included in the site visits and the corresponding dates of the visits.

Table 2-1: Site Visit Dates

Plant	Site Visit Date
A.B. Brown Units 3-6	3/1/2023
Oak Hill Solar	3/1/2023
Highway 41 Solar	3/1/2023
Blackfoot Landfill	3/1/2023
F.B. Culley	3/2/2023
Troy Solar	3/2/2023

At the time of the Study Crosstrack Solar, ██████████ Wind, and Posey Solar had not yet reached commercial operation. As such, 1898 & Co. did not visit these sites. These estimates were based on a desktop analysis of the site documentation provided.

3.0 PLANT DESCRIPTIONS

The following sections provide site descriptions for each of the power plants included in this Study.

3.1 A.B Brown

The AB Brown Generating Station is located in Evansville, Indiana, along the northern bank of the Ohio River approximately 8 miles east of Mount Vernon, Indiana. The plant contains two coal-fired steam turbine units (Units 1 and 2) each with a nameplate capacity of 265.2 megawatts ("MW"). Units 1 and 2 are not included in the scope of this Study. The Plant also has two gas turbines onsite, Units 3 and 4, which came online in 1991 and 2002 respectively. Units 3 and 4 both have name plate capacities of 88.2 MW. Unit 3 is capable of burning natural gas or oil. Unit 4 utilizes natural gas. In addition, two gas-fired CT units are planned to come online in 2025, Units 5 and 6. These units will utilize natural gas and each have a name plate capacity of approximately 235 MW.

3.2 Blackfoot Landfill

The Blackfoot Landfill Plant is located in Winslow, Indiana. The plant consists of two units that came online in 2008 and run primarily on landfill gas. Each Unit has a name plate capacity of 1.6 MW.

3.3 Crosstrack Solar

Crosstrack Solar is a solar farm that will be located in Pike County, Indiana. At the time of the Study the solar farm had not yet reached commercial operation. The project has a planned capacity of 165.69-Megawatt direct current ("MW-DC"). The layout will include approximately 304,020 Longi bifacial solar panels. The solar panels will utilize a single axis-tilt racking system. The solar panels will be arranged in tables of 1 by 27 modules.

3.4 F.B. Culley

The F.B. Culley Generating Plant is located in Newburgh, Indiana. The Plant consists of 1 retired and 2 operating subcritical coal-fired boilers with a total name plate capacity of 368.9 MW. Unit 1 had a nameplate capacity of 42 MW, but has since been retired. The turbine and generator of Unit 1 have been removed. Unit 2 came online in 1966 with a nameplate capacity of 103.7MW. Units 1 and 2 each have electrostatic precipitators. Unit 3 came online in 1973 with a nameplate capacity of 265.2 MW. The steam turbine generators of Units 2 and 3 were manufactured by General Electric. Unit 3 has a fabric filter, SCR, and shares a common flue gas desulfurizer with Unit 2.

3.5 Highway 41 Solar

The Highway 41 Solar facility is located in Haubstadt, Indiana on property owned by SIGECO. The Solar Facility went into operation in 2018 and includes approximately 7,750 REC polycrystalline solar panels with a total capacity of 2 MW-DC. These panels utilize a fixed tilt racking system. The solar panels are arranged in arrays of 2 by 28. Additionally, the site includes a battery energy storage facility, consisting of 1 container with 306 battery modules. The energy storage rating is 1 MW and 4 MWh.

3.6 Oak Hill Solar

The Oak Hill Solar project is located in Evansville, Indiana. The Plant went into operation in 2018 and includes approximately 7,672 REC polycrystalline solar panels with a total capacity of 2 MW-DC. The solar panels utilize a fixed tilt racking system and are arranged in arrays of 1 by 28 modules.

3.7 [REDACTED] Wind

The [REDACTED] wind project will be located in [REDACTED]. At the time of the Study the wind project had not yet reached commercial operation. The site will include [REDACTED] wind turbines with a total capacity of approximately 200 MW. Each tower will have a [REDACTED].

3.8 Posey Solar

The Posey Solar project will be located in Posey County, Indiana. At the time of the Study the solar farm had not yet reached commercial operation. The project has a planned capacity of 228.023 MW-DC and will include approximately 400,464 Jinko Solar monocrystalline solar panels. The solar panels will utilize a single axis tilt racking system and will be arranged in tables of 1 by 27 modules.

3.9 Troy Solar

The Troy Solar project is located in Troy, Indiana. The solar farm went into operation in 2021. The solar farm includes approximately 148,230 First Solar thin-film solar panels with a total capacity of 65.221 MW-DC. The solar panels utilize a single axis tilt racking system and are arranged in tables of 1 by 6 modules.

4.0 DECOMMISSIONING COSTS

4.1 Decommissioning Plan

1898 & Co. has prepared decommissioning cost estimates for the Plants. When CEI South determines that each site should be retired, the above grade equipment and steel structures are assumed to have scrap value to a scrap contractor which will offset a portion of the site decommissioning costs. However, CEI South will incur costs of decommissioning of the Plants and restoration of the sites to the extent that those costs exceed the scrap value of equipment and bulk steel.

The decommissioning costs for each site include the cost to return each site to an industrial condition, suitable for reuse for development of an industrial facility. Included are the costs to dismantle all the assets at the sites, including power generating equipment and BOP facilities, as well as the costs to perform environmental site restoration activities.

4.2 Decommissioning Methodology

For purposes of this study, 1898 & Co. assumed that each site will be dismantled as a single project, allowing the most cost-effective demolition methods to be utilized. A summary of several of the means and methods that could be employed is summarized in the following paragraphs; however, means and methods will not be dictated to the contractor by 1898 & Co. It will be the contractor's responsibility to determine means and methods that result in safely dismantling the Plants at the lowest possible cost.

Asbestos remediation, as required, would take place prior to commencement of any other demolition activities. Abatement would need to be performed in compliance with all state and federal regulations, including, but not limited to, requirements for sealing off work areas and maintaining negative pressure throughout the removal process. Final clearances and approvals would need to be achieved prior to performing further demolition activities.

High grade assets would then be removed from the site to the extent possible. This would include items such as transformers, transformer coils, circuit breakers, electrical wire, condenser plates and tubes, and heater tubes. High grade assets include precious alloys such as copper, aluminum-brass tubes, stainless steel tubes, and other high value metals occurring in plant systems. High grade asset removal would occur up-front in the schedule, to reduce the potential for theft, to increase cash flow, and for separation of recyclable materials to increase scrap recovery. Methods of removal vary with the location and nature of the asset. Small transformers, small equipment, and wire would likely be removed and shipped as-is for processing at a scrap yard. Large transformers, combustion turbine generators, steam turbine generators, and condensers would likely require some on-site disassembly prior to being shipped to a scrap yard.

Construction and Demolition ("C&D") waste includes items such as non-asbestos insulation, roofing, wood, drywall, plastics, and other non-metallic materials. C&D waste would typically be segregated from scrap and concrete to avoid cross-contaminating of waste streams or recycle streams. C&D demolition crews could remove these materials with equipment such as excavators equipped with material handling attachments, skid steers, etc. This material would be consolidated and loaded into bulk containers for disposal.

In general, boilers and Heat Recovery Steam Generators ("HRSG") could be felled and cut into manageable sized pieces on the ground. First the structures around the boilers would need to be removed using excavators equipped with shears and grapples. Stairs, grating, elevators, and other high structures would be removed using an "ultra-high reach" excavator, equipped with shears. Following removal of these structures, the boilers or HRSGs would be felled, using explosive blasts. The boilers would then be dismantled using equipment such as excavators equipped with shears and grapples, and the scrap metal loaded onto trailers for recycling.

After the surrounding structures and ductwork have been removed, the stacks would be imploded, using controlled blasts. Following implosion, the stack liners and concrete would be reduced in size to allow for handling and removal.

BOP structures and foundations would likely be demolished using excavators equipped with hydraulic shears, hydraulic grapples, and impact breakers, along with workers utilizing open flame cutting torches. Steel components would be separated, reduced in size, and loaded onto trailers for recycling. Concrete would be broken into manageable sized pieces and stockpiled for crushing on site. Concrete pieces would ultimately be loaded in a hopper and fed through a crusher to be sized for on-site disposal, if approved for on-site disposal, if approved by the Indiana Department of Environmental Management ("IDEM"), otherwise crushed concrete will be taken to an off-site landfill for disposal.

4.3 General Assumptions

The following assumptions are made as the basis of all cost estimates.

1. Pricing for all estimates is in current 2023 dollars.
2. All work will take place in the most cost-efficient method.
3. Labor costs are based on Union labor rates for a 40-hour workweek.
4. For purposes of this Study, it is assumed that all generating units at each power station will be dismantled as part of a single demolition project.
5. Units will be decommissioned to zero generating output. Existing utilities will remain in place for use by the contractor for the duration of the demolition activities.
6. CenterPoint will remove or consume all burnable coal, fuel oil, and chemicals to the reasonable extent possible prior to commencement of demolition activities. Costs for these activities are not included in the estimate.
7. Costs are included in the estimates for cleaning and flushing fuel oil tanks and lines. Costs have also been included to remove three feet of soil directly below each of the fuel oil tanks and five feet of soil beneath the fuel oil lines to account for the potential for this soil to be contaminated during normal operations.
8. Costs are included in the estimates for draining and disposing of transformer oils.
9. Soil testing or any other applicable on-site testing has not been conducted for this Study. Any environmental clean-up or removal costs are based on previous testing or assumed levels of contamination.
10. No environmental costs have been included to address cleanup of contaminated soils, hazardous materials, or other conditions present on-site having a negative environmental impact, other than those specifically listed here. No allowances are included for unforeseen environmental remediation activities.

11. Hazardous material abatement is included for all sites as necessary, including asbestos, mercury, and polychlorinated biphenyls ("PCBs"). Lead paint coated materials will be handled by certified personnel compliant with OSHA Standards as necessary but will not be removed prior to demolition.
12. Abatement of asbestos will precede any other work. After final air quality clearances have been reached, demolition can proceed. However, some abatement, including the removal of non-friable gaskets and packings will commence in conjunction with the demolition. If asbestos containing materials are found within the interior of boilers, stacks, ductwork, or other equipment (including refractory), abatement will be coordinated closely with demolition.
13. All demolition and abatement activities, including removal of asbestos, will be done in accordance with all applicable Federal, State and Local laws, rules, and regulations.
14. Transmission switchyards and substations within the boundaries of the plant are not part of the demolition scope. For purposes of this Study, the division between generation assets and transmission assets is at the high side of the generator step-up transformers.
15. It is assumed that the PCB concentrations are below 50 ppm and will not be required to be disposed in a Toxic Substances and Control Act ("TSCA") permitted landfill.
16. The costs for relocation of transmission lines, or other transmission assets, are specifically excluded from the decommissioning cost estimates.
17. All above-grade structures will be demolished, unless otherwise noted herein. All below-grade foundations and piles will be removed to two (2) feet below existing grade, unless otherwise noted in the site-specific assumptions. Foundations deeper than the specified depth of removal will be abandoned in place.
18. Existing basements will be used to bury non-hazardous debris. Concrete in trenches and basements will be perforated to create drainage. Non-hazardous debris, such as concrete and brick, will be crushed and used as clean fill on-site once the capacity of all existing basements has been exceeded, pending approval by IDEM. All inert debris will likewise be used as clean fill on-site, pending approval by IDEM. All other material that is not sold as scrap will be disposed of at an off-site landfill.
19. Underground structures with cavities will be permanently sealed two feet below grade unless another depth of removal is specified herein. Examples include cable tunnels and vaults, coal reclaim conveyor tunnels, and rotary car dumper structures.
20. All roads, paving, crushed rock surfacing, and rail lines will be removed and costs for removal have been included in the Study, unless otherwise noted herein.
21. Costs are included for crushing concrete as well as transporting and disposing of the concrete at an off-site landfill. To the extent possible, clean concrete may be crushed and used as clean fill on-site, pending approval by IDEM. All other material that is not sold for scrap will be disposed of at an off-site landfill.
22. Except for the circulating water lines, underground piping will be capped and abandoned in place. Circulating water piping will be excavated to the top of pipe, the top of pipe will be broken, and backfilled with flowable fill.

23. Site areas will be graded to achieve suitable site drainage to natural drainage patterns and seeded, but grading will be minimized to the extent possible.
24. Major equipment, structural steel, turbines, generators, exhaust stacks, transformers, electrical equipment, cabling, wiring, pump skids, above ground piping, and equipment enclosures for the above equipment will be sold for scrap and removed from the Plant site by the demolition contractor, after confirmation of acceptable PCB levels within the equipment. All other demolished materials are considered debris.
25. For purposes of this Study, it is assumed that none of the equipment will have a salvage value in excess of the scrap value of the materials in the equipment at the time of decommissioning. The decommissioning cost estimate is based on the end of useful life of the facility. All equipment, steel, copper, and other metals will be sold as scrap. Credits for salvage value are based on scrap value alone. Resale of equipment and materials is not included.
26. Valuation and sale of land and all replacement generation costs are excluded from this scope.
27. Spare parts inventories were not provided to 1898 & Co. for review. 1898 & Co. assumes that to the extent possible spare parts will be sold prior to decommissioning and remaining spare parts will be scrapped by the demolition contractor.
28. The scope of the costs included in the Study is limited to the decommissioning activities that will occur at the end of useful life of the facilities. Additional on-going costs may be required, including, but not limited to groundwater monitoring associated with ash pond closure and/or other environmental monitoring activities. These costs are excluded from the cost estimates provided in this study, unless otherwise noted in site specific assumptions.
29. A 20 percent contingency is included on the direct costs in the estimates prepared as part of this Study to cover unknowns. The Owner's indirect costs are included as 5 percent of the direct costs.
30. Market conditions may result in cost variations at the time of contract execution.
31. Scrap values will be based upon an average of monthly American Metal Market prices for the past calendar year (12 months). The values will be inclusive of the cost to haul the scrap via truck and/or rail to the identified scrap market hub.
32. The following scrap values were used in the decommissioning cost estimates. The scrap values are based upon an average of monthly American Metal Market prices from March 2022 to February 2023 (one calendar year) for the given material less the transportation costs required to haul the scrap via truck and/or rail to the major market indicated below.

Table 4-1: Scrap Pricing

Plant	Scrap Market Location	Steel Scrap Value (\$/net ton)	Copper Scrap Value (\$/pound)	Aluminum Scrap Value (\$/pound)	Brass Scrap Value (\$/pound)
A.B Brown Units 3-6	Chicago	\$ (302.51)	\$ (2.90)	\$ (0.40)	\$ (2.33)
Blackfoot Landfill	Cincinnati	\$ (303.38)	\$ (2.90)	\$ (0.40)	\$ (2.33)
Crosstrack Solar	Cincinnati	\$ (305.69)	\$ (2.90)	\$ (0.40)	-

Decommissioning Cost Estimate

Decommissioning Costs

Plant	Scrap Market Location	Steel Scrap Value (\$/net ton)	Copper Scrap Value (\$/pound)	Aluminum Scrap Value (\$/pound)	Brass Scrap Value (\$/pound)
F.B. Culley	Chicago	\$ (303.59)	\$ (2.90)	\$ (0.40)	\$ (2.33)
Highway 41 Solar	Chicago	\$ (302.89)	\$ (2.90)	\$ (0.40)	-
Oak Hill Solar	Chicago	\$ (306.99)	\$ (2.90)	\$ (0.40)	-
██████████ Wind	Chicago	\$ (294.28)	\$ (2.89)	\$ (0.39)	-
Posey Solar	Chicago	\$ (305.31)	\$ (2.90)	\$ (0.40)	-

4.4 Site Specific Assumptions

The following assumptions were made specific to each site, in addition to the general assumptions listed above.

4.4.1 A.B. Brown

1. Costs are not included for removal of the coal units, Units 1 and 2, and their associated facilities, unless otherwise stated herein.
2. It is assumed Units 3-6 have no asbestos.
3. Costs for removal of the river intake structure are included.
4. The scope of removal includes the water storage and condensate storage tanks located by the transformers.
5. Costs are included for the removal of the Ranney wells.
6. At the time the coal units are decommissioned it is assumed that the following facilities will be relocated to remain in service for use by the simple cycle units. As such, the costs for removal of these facilities are included in this Study:
 - o Reverse Osmosis System
 - o Service compressors
 - o Microwave unit tower (located on Unit 1 stack at the time of the Study)
 - o Oil storage
7. It is assumed that the road between Units 1 and 2 will have been previously removed at the time of decommissioning of the coal units and is not in the scope of the Study. Costs for removal of all other roads are included in the cost estimate.
8. Costs are included for removal of the administration and maintenance buildings, the construction services building, liquid product tank farm, and parking structures.
9. Costs are included for removal of the station transformers.
10. It is assumed the rail loop surrounding the Plant area for coal operations will have been previously removed at the time of decommissioning of the coal units and is not included in the scope of Study. Costs for removal of the rail lines directed towards the main area of the Plant are included in the estimate.
11. Costs are included for closure of the sedimentation basin and capital pond, including the removal of the liner systems. The capital pond is assumed to have an average depth of approximately 10 feet of residuals at the time of closure. Costs are included for removal of the residuals, which are assumed to be disposed of onsite. Costs are also included for grading and seeding these areas as needed.

12. Costs are included for closure of the new lined coal combustion residuals ("CCR") pond and the new lined contact stormwater pond, including removal of the liner systems, fill of the areas, returning to grade, and grading and seeding as needed.

4.4.2 Blackfoot Landfill

1. There is assumed to be no asbestos on site.
2. It is assumed that ownership ends at the fence line, as such costs for removal of collection piping and equipment outside of this area are not included.
3. Additionally, it is assumed the ponds surrounding the facility are not owned by CenterPoint, and costs for closure are not included.

4.4.3 Crosstrack Solar

1. Section 13.3 of the Solar Lease and Easement Agreement states, Grantee shall "remove above-ground and below-ground (to a depth of three (3) feet below grade) Solar Facilities from the Property."

4.4.4 F.B. Culley

1. Asbestos quantities of 5 percent were assumed to remain for each Unit. Quantities were not provided by CenterPoint.
2. The condenser tube material for Units 2 and 3 is assumed to be Brass. The exact material was not specified in documentation provided for review.
3. The steam turbine and generator of Unit 1 have been removed as of the time of this Study and are not included in the cost estimate.
4. The barge unloading facility is assumed to be removed as part of decommissioning.
5. At the time of the Study, the west ash pond had been closed under the requirements of the CCR rules and the east ash pond was in the process of being retired. As such, costs for removal are not included.
6. End-of-life costs for closure of the closed solid waste unit are not included in the cost estimate.
7. Costs are included for closure of the new lined pond, including removal of the liner system, fill of the area, returning to grade, and grading and seeding as needed.

4.4.5 Highway 41 Solar

1. A removal depth of 3 feet below grade was assumed.
2. The battery disposal fees are assumed to be at the expense of the Project.

4.4.6 Oak Hill Solar

1. Article IX(B)(2) of the Lease Agreement states that Vectren shall "remove all above-grade elements of the Solar Farm and personal property from the Leased Premises, except for any perimeter fencing, provided roads, driveways and underground utilities may remain and Vectren shall not be required to landscape vacated areas."

4.4.7 [REDACTED] Wind

1. It was assumed that all disturbed areas will be restored to original grade, reclaimed with native soils, seeded, and replanted with native vegetation consistent with the surrounding land use.
2. All underground equipment will be removed to a depth of 60 inches below grade in accordance with Section 21 of the Agricultural Impact Mitigation Agreement between [REDACTED] and the Illinois Department of Agricultural and Appendix E of the [REDACTED] Zoning Ordinance (which requires removal to a depth of 48 inches below grade). All non-hazardous structures or foundations greater than 60 inches below grade will remain and are excluded from the decommissioning estimate.

4.4.8 Posey Solar

1. Attachment A of the Posey County Decommissioning Plan Agreement states, "Decommissioning includes removing the solar array equipment to a depth of five (5) feet. Access roads and drainage structures will be removed unless requested to remain in place by the landowner. Standard decommissioning practices would be utilized, including dismantling and repurposing, salvaging/recycling, or disposing of the solar energy improvements and disposal of hazardous material. Access roads and other compacted areas would be decompacted and topsoil replaced. Final restoration shall include re-vegetation as pasture, returning the site to agricultural use, or returning the site as close as possible to its pre-construction condition."
2. Costs are included for removal of the collector substation and overhead gen-tie line.

4.4.9 Troy Solar

1. A Lease Agreement was not provided for review including removal requirements. As such, a removal depth of 3 feet below grade was assumed.

5.0 RESULTS

1898 & Co. has prepared cost estimates in 2023 dollars for the decommissioning of the Plants. These costs are summarized in the following table. When CEI South determines that the Plants should be retired, the above grade equipment and steel structures are assumed to have sufficient scrap value to a scrap contractor to offset a portion of the decommissioning costs. CEI South will incur costs in the demolition and restoration of the sites less the salvage value of equipment and bulk recycled metals.

Table 5-1: Decommissioning Cost Summary (2023\$)

Plant	Gross Decom Cost	Salvage Credit	Net Project Cost
A.B Brown Units 3-6	\$ 12,261,000	\$ (5,117,000)	\$ 7,144,000
Blackfoot Landfill	\$ 295,000	\$ (149,000)	\$ 146,000
Crosstrack Solar	\$ 18,975,500	\$ (4,230,800)	\$ 14,744,700
F.B. Culley	\$ 41,515,000	\$ (11,063,000)	\$ 30,452,000
Highway 41 Solar	\$ 457,700	\$ (108,300)	\$ 349,400
Oak Hill Solar	\$ 358,600	\$ (84,700)	\$ 273,900
██████████ Wind	\$ 11,592,500	\$ (7,368,000)	\$ 4,224,500
Posey Solar	\$ 24,250,000	\$ (5,926,100)	\$ 18,323,900
Troy Solar	\$ 10,667,000	\$ (2,258,200)	\$ 8,408,800
FLEET TOTAL	\$ 120,372,300	\$ (36,305,100)	\$ 84,067,200

The total projects costs presented above include the costs to return the sites to an industrial condition suitable for reuse for development as an industrial facility. Included are the costs to dismantle all power generating equipment and balance of plant facilities and, where applicable, to perform environmental site restoration activities. Further details including estimates for the major cost categories of each plant are provided in Appendix A

APPENDIX A - COST ESTIMATE SUMMARIES

Table A-7: Estimated Cost for Wind Turbine Decommissioning (2023\$)**Wind Project**

Decommissioning Cost Evaluation

Wind Turbine Removal Cost

Removal	\$	2,292,000
Hauling & Disposal	\$	627,000
Total	\$	2,919,000
Scrap Value	\$	(7,108,000)

Wind Turbine Foundation Removal Cost

Removal	\$	1,871,000
Hauling & Disposal	\$	2,238,000
Total	\$	4,109,000
Scrap Value	\$	-

Collection System Removal Cost

Removal	\$	31,000
Hauling & Disposal	\$	6,000
Total	\$	37,000
Scrap Value	\$	-

Substation Removal Cost

Removal	\$	252,000
Hauling & Disposal	\$	33,000
Total	\$	285,000
Scrap Value	\$	(129,000)

Transmission Line Removal Cost

Equipment Removal	\$	805,000
Hauling & Disposal	\$	482,000
Total	\$	1,287,000
Scrap Value	\$	(107,000)

Civil Works Removal Cost

Removal	\$	213,000
Hauling & Disposal	\$	200,000
Grading & Seeding Costs	\$	109,000
Total	\$	522,000
Scrap Value	\$	-

O&M Facility Removal

Removal	\$	25,000
Hauling & Disposal	\$	12,000
Total	\$	37,000
Scrap Value	\$	(15,000)

Met Tower Removal

Removal	\$	24,000
Hauling & Disposal	\$	1,000
Total	\$	25,000
Scrap Value	\$	(9,000)

Other Costs

Oils & Chemicals Removal & Disposal	\$	53,000
Total	\$	53,000

Total Estimated Cost	\$	9,274,000
Owner Indirects (5%)	\$	463,700
Contingency (20%)	\$	1,854,800
Total Gross Cost	\$	11,592,500
Total Scrap Value	\$	(7,368,000)
Total Net Cost	\$	4,224,500
